-----------------	-----

INTRODUCTION

“FEDERAL Finance in Peace and War” is an Enquiry complementary to that made into the burden of taxation,¹ and has been undertaken in consultation with the National Institute of Economic and Social Research, without whose assistance it could never have been instituted. It has involved a somewhat minute study of the Budgets and other Financial Statements of the United States of America, Canada, Australia, South Africa and India. These countries were selected because they possess fundamental constitutional likenesses and continuity of history, which make the treatment of their systems of public finance a suitable single field of study. It was decided to restrict the Enquiry for two reasons. In the first place, it was not possible to cover all Federations in the world, such as Switzerland, Germany, Russia, Mexico, Brazil and the Argentine, and, secondly, a description of the temporary structures of totalitarian countries, such as Germany, would be largely dependent upon political analysis. Municipal as well as Provincial or State finance has been examined as it is intimately connected with the Central or Federal Government’s finance. The years chosen for examination include the pre-rearmament year 1937–38 and a recent war year, usually 1941–42. The effects of the greatest depression of the machine age, that of 1929–32, have been so widespread as to affect to a very remarkable degree the tax structures, and on this account crisis finance could not be omitted.

It is well known that a Budget covers only part of a nation’s economic and financial activity; and, therefore, in the early stages of the Enquiry it was realised that a study of the National Income technique of Public Finance had to be considered. This meant that attention had to be given to the National Income, Public Expenditures and Public Debt, apart altogether from a study of the tax structures of the countries and of the units in the Federations. It has been rightly pointed out that a Budget is not a balance-sheet in which all assets and liabilities of the concern are given, but is similar to a Profit and Loss account of a business enterprise, only the changes are over a twelvemonth. The Budget itself is no longer regarded as the national balance-sheet but only a part of it. In short, we have to take into consideration the quantitative estimate

¹ G. Findlay Shirras and L. Rostas, *The Burden of British Taxation*. The National Institute of Economic and Social Research Studies No. 2, Cambridge University Press, 1942, also American Edition, The Macmillan Company, New York, Jan. 1943.

of the whole economic activity of the country and not merely the cross-section of it with which the Government is concerned. When unemployment is at its worst an expansion, and not a contraction, of public expenditure to meet the decline in tax revenue is essential. It is only within recent years that in official circles it has been realised that unemployment could be avoided by a policy of regular and large Government expenditure.¹ Deficits are not, as Gladstonian finance always regarded them, thoroughly bad in themselves and to be avoided; they are even desirable for the stabilisation of economic life. Nothing has been so revolutionary in public finance in recent years as this idea of the inclusion of items hitherto undreamt of in the philosophy of budgetary finance. Since 1941 annual tax proposals have been based on an examination of the nation's total income and expenditure as set out in the White Paper on "The Analysis of the Sources of War Finance and an Estimate of the National Income and Expenditure". From this the so-called "Inflationary gap" can be measured. We have to consider not merely the domestic expenditure and revenue of the Government but overseas resources, extra-Budgetary receipts, sums available for investment as depreciation in war-time cannot be made good, and, most important of all, new savings obtained through the National Savings movement and similar movements for investment. Similarly, there is the "Deflationary gap" in budgeting for full employment. The difference between the potential savings of the community, the savings if the national resources had been fully used in production, and the actual loan expenditure on capital construction by private firms, individuals and local authorities other than the Central Government, has to be made good by the Government's supplementing this regularly to the extent of the difference. It has also been realised that tax policy as well as expenditure has a part to play in economic stability. May not taxation play its part as a factor helping inflation or deflation, expansion or contraction? May not a planned system of taxes be flexible enough to be used to increase or decrease saving or investment? (In the downward swing of the trade cycle, tax policy may remove maladjustments by a relatively light tax burden upon spending and a relatively high tax burden on surplus savings. A tax policy might aim at reducing liquidity preference, *e.g.* in regard to undistributed profits to prevent relapse and at another to prevent excessive

¹ Accepted by the British Government in 1944, *vide* White Paper on Employment policy (Cmd. 6527), "The Government accept as one of their primary aims and responsibilities the maintenance of a high and stable level of employment after the war."

expansion by curtailing excessive profits. In both cases stability would be assisted. Even if purchasing power is being restored by Government expenditures, a taxation policy is complementary and worthy of examination, as a tax system often has many taxes the effect of which is the curtailment, during a depression, of consumers' purchasing power. In other words, the effects of a taxation policy must be considered as well as a policy of public expenditures. Financial equilibrium is not merely equilibrium of Budgetary revenue and expenditure but equilibrium of the country's annual income and expenditure, an equality between spendable income and available resources. This may indicate in the future, at all events in the countries of chief industrial importance, the very countries which tend to save too much, the presentation of a Capital Budget quite apart from a Revenue Budget. For this and other reasons in this Enquiry a study of National Income, Public Expenditures and Public Debt has been linked up with an analysis of tax structures.

The report is divided into three parts. The first deals with the Scope and Method of the Enquiry and the Public Finance and National Economy of the oldest of the Federations, the United States, and a similar analysis of the Federations comprising the British Commonwealth — Canada, Australia, South Africa and India. The tables in Part I are Summary tables and are set out in the table of Contents. Part II consists of the general principles underlying the study of Part I with special reference to intergovernmental financial relations, not merely as applied to conflicts between Federal and State Governments, between State and Local Governments and Federal and Local Governments or between States of the Federation or between Nations, but also to financial relations in regard to specific taxes and specific functions. It deals also with the solutions for these conflicts. Part III contains statistical tables other than the Summary tables in Part I. An Index has been prepared for facility of reference.

I desire to place on record my deep sense of appreciation to the Governments which have not only provided official data but explanations regarding financial relations. My second duty is to thank the High Commissioners of Canada, Australia, South Africa and India ; the Dominions Office ; the American Embassy in London ; the American Treasury Committee, over which Professor Luther Gulick was Chairman ; the Rt. Hon. Viscount Bennett, P.C., K.C., LL.D., formerly Minister of Finance and, from 1930 to 1935, Prime Minister of Canada and member of the Council of University College, Exeter ; Dr. S. A. Cudmore, Dominions

Statistician, Canada ; Professor Haig of Columbia University, New York ; Miss Mabel L. Walker, Director of the Tax Institute of the University of Pennsylvania ; and many other non-official experts. Mr. Henry Clay and Mr. Geoffrey Crowther have acted as the Sub-Committee of the Institute connected with the Enquiry, and their judgment on various points has been of great value. Mrs. F. Stone, Secretary of the National Institute of Economics and Research, has always been most ready to serve the interests of the Enquiry, and her ability and tact have been greatly appreciated. Dr. G. Rusche and, especially, my Research student, Mr. J. R. L. Schneider, B.Sc., have assisted with the heavy statistical work, and Miss Joan Ambrose and Mrs. W. M. Timms have performed the secretarial work of the Enquiry with energy and success. Mrs. E. J. Condon greatly assisted with the proofs and with the Index.

G. FINDLAY SHIRRAS

15th January 1944

PART I

CHAPTER I

THE SCOPE OF THE ENQUIRY

IN the Introduction the limitation of the scope of the Enquiry has been discussed. The selection of the years was intended to cover the pre-rearmament period and the war period as well as the crisis of 1929-32 which has had so lasting an effect on Federal Finance. The pre-rearmament year of 1937-38 was taken as a most typical pre-rearmament year.

In the last decade all Federal systems of government have been subjected to much strain, and the questions underlying Federal Finance have received a new emphasis. This has been especially true in the United States and in the Federal States of the British Commonwealth. The Federal State, as is known, rests on the assumption that sovereignty in a single State can be divided among several Governments which act independently of one another. There are always, however, two distinct and conflicting forces at work. In the first place, there is the unifying influence brought about by common interests and common aims which can best be promoted by union. On the other hand, there is the desire of the States or Provinces and Local Authorities to preserve a large measure of their independence. A Federal State or Union is in fact a marriage of convenience. Interdependence reduces independence, and in recent years there has been a continuous drive towards centralisation. It is here that the Federal dilemma lies. On the one hand, with the great increase of transport and communications and the growth of large-scale organisation there has been considerable integration in the Federal State, as was well shown in the greatest depression of the machine age, the depression of 1929-32. There has been a great development of Government intervention in economic and social matters. In short, there is the move towards centralisation, but, on the other hand, if the units do not resist this tendency towards centralisation, the Federal system may be seriously weakened at its foundations. With the rising costs of government, new activities are demanded and higher standards are required for old ones. This can be seen in the large increases in expenditures on development as well as on the social services in all the countries studied. All Governments, including Federal Governments, are increasing considerably their grip on the economic life. Governments to-day are taking a much larger share of the national income than ever before. In

the United States, for example, Federal, State and Local taxes were the equivalent of 4 per cent of the national income in 1850, 10 per cent in 1900, between 20 and 25 per cent in the years immediately preceding the war, 28 per cent in 1940-41, and in 1941-42 at least one-third of the national income excluding the social security taxes. The total expenditures, National, State and Local, as given in Table VI, Chapter III, show that the total expenditure as a percentage of the national income is not less than 41 per cent in 1942 as compared with 27 per cent in 1941. The Finance Minister of Canada has stated that the expenditures of the Dominion Government, including the assistance given to the United Kingdom but excluding all Provincial and Municipal expenditures, amounted in 1942 to nearly 50 per cent of the national income. Before the war it was estimated that Federal, Provincial and Municipal authorities spent from 25 to 30 per cent of the national income, and this included heavy expenditures for unemployment and agricultural relief.

In periods of national emergency, State and Local Government Budgets are eclipsed by Federal Budgets, but in normal periods between war and depressions, State and Local expenditures have exceeded Federal expenditures. Thus, in the United States, although Federal revenues and expenditures have greatly expanded in the last ten years, it is only since the current fiscal year that Federal taxes have exceeded aggregate State and Local taxes. In Canada in 1937 Dominion taxation amounted to \$464 millions while Provincial and Municipal revenues were respectively \$244 millions and \$309 millions.

We discuss elsewhere the problem of competition and co-operation among taxing authorities in Federal States, but it will be sufficient if we state here that this urge towards centralisation is characteristic of the unification of the national economy and of the enormous growth in Government spending. The taxation of surplus income through progressive taxes is admirably suited for centralisation or Federal collection, and this is one of several reasons why, when Governments absorb a large fraction of the national income in taxation, the taxation system itself assumes great economic importance.

With the passing of the Social Security Act of 1935 in the United States, the Federal Government increased its financial power considerably. In 1930 the grants to the States were less than \$150 millions covering eleven State activities. Emergency grants in connexion with the depression and the Social Security plan of the New Deal brought the total to about \$800 millions in 1939, and the aided activities increased to twenty-one. About 14 per cent of the total revenues of the State Government now comes from Federal grants. Indeed, as will be seen later, there is springing up, in consequence of the dominance of Federal Government in

recent years, a new Federalism — a co-operative Federalism replacing the old Federalism in which the Federal or National Government and the units went their separate ways without regard to what the others were doing. Thus in one year, 1937, over one hundred statutes were passed by forty States to aid the United States Federal Housing Administration alone.¹ The scale of Government action, in short, is now such that it affects to a very large degree the working of the national economy of a country, and tends everywhere to increase rather than to diminish. The competition between Federal, State and Local Governments for revenues is growing, and there is a decided tendency for the Federal authority to use its wider taxation powers to control the layers of government below it. There is a good deal of overlapping as we shall see. In the United States, for example, more than 90 per cent of combined Federal and State tax yields come from common tax bases. Only customs duties are denied to the States and only the property tax and motor vehicle duties are not available to the Federal Government. The multiplicity of tax authorities has been much in evidence in recent years. The number in the United States is usually estimated at 175,000.

Another interesting feature of Federalism is the changing nature of the tax systems of Federal and State Governments which is in contrast to the negligible changes in local taxes. Customs duties and taxes on liquor and tobacco were, at the beginning of the present century, the main sources of Federal revenue in the United States; to-day they produce only one-fourth of the Federal tax revenues. At the present time State Governments are obtaining 75 per cent of their taxes from sources that were negligible or non-existent at the beginning of the century. Local Governments, on the other hand, still obtain a great proportion of their revenue from the taxation on property.²

Events such as have been referred to in the above paragraphs have produced considerable discussion in recent years. A Royal Commission on Dominion-Provincial Relations was appointed in Canada in August 1937, and its Report in three volumes was submitted in March 1940 and published in March 1941.³

This monumental Report will long be a *locus classicus* on Federal

See Appendix I.

Finance. The Commission was appointed because of general dissatisfaction in respect of Dominion-Provincial Relations, a dissatisfaction which reached an acute stage during the depression of 1929-32. Provincial and Local Governments were unable to deal with unemployment and agricultural distress, and the resulting financial difficulties in regard to administrative responsibility meant a serious strain on national unity. By an amendment to the British North America Act, the Dominion was able to introduce, as from 1st July 1941, a nation-wide scheme of unemployment insurance much the same as that existing in the United Kingdom. As will be seen in Chapter IV on Canada, the Dominion Government decided to accept the Commission's proposals to take over the whole burden of relief for the employable unemployed and their dependants, and so relieve the Provinces and, therefore, also the Municipalities. The Dominion Government also agreed to take over, as recommended by the Commission, the whole burden of Provincial net debt. In return for this, as recommended by the Commission, the Dominion Government was to have the exclusive right to tax personal incomes and corporations and to levy succession duties. National adjustment grants which were to be made to the Provinces were calculated to enable them to maintain an average Canadian standard of essential services with an average level of taxation.

Similar discussions had been going on in the United States prior to the appointment of a Committee by the American Treasury. The Chairman of the Board of Governors of the Federal Reserve system, for example, addressed the National Tax Association at the University of Minnesota in October 1941.¹ In this address the Chairman of the Board, Mr. Eccles, outlined some of the difficulties which were facing the United States to-day in some of the broader aspects of taxation. He pointed out that, except during major wars, the State and Local Governments of the United States had only been much more important from the revenue point of view than the Federal Government, and it was only in the fiscal year 1941-42 that Federal taxes exceeded aggregate State and Local taxes. Mr. Eccles stressed the importance of safeguarding against the danger of a relapse into what he called "the intolerable conditions of the early 30's", by a "long run plan for public investment, adapted to the differing needs and conditions of the different geographical areas of the United States". He outlined a scheme for productive public investment which should be non-competitive with private enterprise and dealt with social security, old-age pensions and unemployment benefits. In his

¹ Address by Marriner S. Eccles, Chairman of the Board of Governors of the Federal Reserve System, at a meeting of the National Tax Association at the University of Minnesota. *Federal Reserve Bulletin*, Nov. 1941.

view he believed that if progressive taxes were to be the major element of the national tax structure, it would not be possible to continue the present system of having the Federal Government and the States levying taxes on individual and corporate incomes and transfers at death. Uniformity and equity could be attained, in his view, by making the total levied on income and on inheritance a matter for Federal control, and State revenues must tend more and more to consist of taxes shared with the Federal Government which already amount to 14 per cent of State revenues. He added : " We should continue to follow the broad policy that has grown out of these activities of leaving responsibility for initiative as to the type of activity to be undertaken in the hands of State and Local Government, to leave, wherever possible, the detailed administration in their hands and to provide for Federal supervision only to the extent necessary to ensure that funds are wisely, prudently and honestly used ".

In view of these remarks from so high an official, it was no surprise that Professor Luther Gulick was asked by the Treasury to conduct an Enquiry into the tax system of the United States with special reference to intergovernmental financial relations. It is not, however, only in the United States and Canada that in recent years the problem of intergovernmental financial relations has become acute, but also in other Federations which we have studied. In Australia there have been since 1934 the Reports of the Commonwealth Grants Commission, dealing with special subventions to the States of South Australia, Western Australia and Tasmania, in which the taxable capacity of these Provinces is shown to be less than in the more industrially advanced Provinces of Victoria and New South Wales. During 1941 the Commonwealth Government attempted to induce the States to accept a plan by which it would become the only authority in Australia to levy income tax, the Commonwealth Government providing for the States out of the proceeds of its uniform taxation. The difficulty arises from the fact that the Federal Government is hampered because the amounts levied in State income tax are in some cases very high. The taxpayer in Queensland, for example, has to pay to the State Treasurer more than twice as much as a taxpayer earning the same income in Victoria. All the State Premiers, except the Premier of South Australia, opposed the proposal of the Commonwealth Government at the Loan Council of Canberra at the end of June 1941. The difficulties can well be seen by the statement of the Premier of Victoria, who protested that it was proposed to penalise Victoria for her long record of prudent finance to relieve the extravagant States and, if the State vacated the income tax field, there would be a large increase in Federal taxation on low and medium size incomes in Victoria to bring the total taxation to that of Queensland and New South Wales. A Committee, consisting of

Professor R. C. Mills of Sydney University, the Right Honourable J. H. Scullin, Prime Minister of Australia 1929-31, and Mr. Spooner, subsequently appointed to consider a scheme of uniform income taxation for the Commonwealth, presented a Report recommending that the Commonwealth alone during the war and for one year afterwards should be the sole income taxing authority, and that a scheme of uniform taxation should take place from 1st July 1942, compensation being paid to the States for loss of revenue. The Report was discussed at a Conference of Premiers of the States on 22nd April 1942. As explained in the chapter on Australia (Chapter V, section II) a Constitutional Convention at Canberra approved a Bill in December 1942 transferring from the States to the Commonwealth fourteen specific powers for purposes of post-war reconstruction for five years after the cessation of hostilities. These new powers will be in operation only when the bill has been passed by all the States. Considerable opposition was offered to the passage of the bill in South Australia, West Australia and Tasmania on the ground that the powers proposed to be transferred were not sufficiently clearly defined.

In 1933 in the Union of South Africa a Provincial Finance Commission was appointed, with Mr. J. de V. Roos as chairman. This Commission reported towards the end of 1934, and, as a result of the Report, an Act was passed and a consultative Committee, consisting of the Administrators and the Executive Committee of the four Provinces, was established. This Committee is presided over by the Minister of the Interior, and meets when necessary to discuss matters common to the four Provinces. Under this Act an increased annual subsidy was paid to Natal. Subsequent to the appointment of this Commission a fact-finding Committee was set up to deal with financial relations.

In India, too, a long series of investigations have been made over fourteen years by a Royal Commission, several Committees and Round Table Conferences, and in 1936 by Sir Otto Niemeyer, now an official of the Bank of England. The Government of India Act of 1935 came into force so far as Provincial autonomy was concerned on 1st April 1937. The part of the Act dealing with Federal government, however, has not been brought into operation and never will be in the form of the 1935 Act, for reasons stated in Chapter VII. The British Cabinet offer of March 1942, of complete self-government in India, has put the whole matter of the Constitution, and therefore of financial relations, again in the melting-pot.

CHAPTER II

THE METHOD OF THE ENQUIRY

FOR purposes of analysis it has been necessary to classify tax systems, public expenditures and public debts and to lay down some basic principles which are widely accepted to enable us to arrive at the standards which go to make a sound system. As far as practicable an attempt has been made to evaluate the burden of taxation and to test its fairness, not merely between individuals and between taxes but also between regions in a Federation. It is sometimes forgotten how complex Federal systems are. In New York State, for example, there are approximately 150 taxes, 100 of which are Federal, 38 State and 7 Local. The exact number, of course, depends on the difference of base and of rate. There is, too, a glaring inequity of taxation in some Federations. If, for example, we take the taxes in one Province as a percentage of the total income of the area or of the surplus income, *i.e.* the total income less the cost of subsistence of the population in the area, we often find that the burden of taxation varies considerably between States or Provinces and that it is highest in those States or Provinces where the relative taxable capacity is low. It is on this account to-day that Governments aim at providing directly or indirectly normal social or developmental services, and in the carrying-out of this recourse is had to the progressive taxes, income taxes and succession duties, which, in order that they should be uniform throughout the Federation, should be entrusted to the Federal Government. Every unit should supply an adequate minimum of the social services and developmental expenditure. If it does not, it endangers the Federation. Among the new problems affecting the financial relations of the Federal Government and the units, not least is the permanent provision for the relief of unemployment. This is one of a number of problems that have arisen from the relative effects on Federal and State or Provincial finance of the great depression and of the financial policy undertaken in each Federation to solve it. In spite of the integration that has taken place in recent years, there is always present on the part of the less prosperous Provinces the suspicion that their interests are disregarded by the Federal Government and the richer units. This endangers national unity. Nothing, in fact, has received so much attention in recent years as the necessity of maintaining economic balance in federal systems. In Australia the State of Western Australia has considered withdrawing

from the Commonwealth, as within the Federation where free trade prevails it cannot compete, it is alleged, with the industrially advanced States of Victoria and New South Wales.¹ The interests of the Prairie Provinces and the Maritime Provinces of Canada have received special attention in the recommendations of the Royal Commission on Dominion-Provincial Relations. In the United States the accumulated wealth of the Eastern States contrasts with the younger States which were gradually opened up to settlement. The former have found the latter an outlet for investment and a market for their industrial products. The Chairman of the Board of Governors of the Federal Reserve System emphasised this when he said that "The maintenance of economic balance in the country as a whole requires that citizens of debtor areas have enough money income both to maintain interest, amortisation and other payments on their obligations to investors in the creditor areas and to maintain at a high level their purchases of the output of the factories of the creditor areas. They must maintain their standing both as good credit risks and as good customers. This healthy state of national economic balance is continually being upset by forces that are entirely outside the control of the States or of the individual business man and the individual worker. The result is recurrent periods of breakdown and distress, bankruptcy in debtor areas, idle factories in creditor areas and widespread unemployment and hardship in the country as a whole. There is no essential difference between this situation and that resulting from international debts. Both are, in essence, exchange problems. By tariffs, quotas, exchange restrictions, or even by resort to more punitive steps of a military or economic nature, including expropriation, nations attempt to redress the situation. The Federal Government alone can remedy this condition among the States — and taxation is one of the most effective means. Through that medium funds which the creditor areas drain out of debtor areas through interest, dividends and rents, as well as payments on debt, can be kept flowing back to sustain employment, to keep mines and factories in the debtor areas in operation and continuing to yield returns to the creditor areas."² In no other way can the debtor areas, in his view, continue to yield returns to the creditor areas. He advocates a progressive tax system bearing heavily upon savings concentrated in creditor areas and lightly upon the great mass of families of the low income groups.²⁾

Before examining the characteristics of a fair and efficient Federal tax

¹ Cf. the Government Report on "The Case of the People of Western Australia in support of their desire to withdraw from the Commonwealth of Australia". Perth, Government Printer, 1934.

² Address to the National Tax Association, 14th Oct. 1941. *Federal Reserve Bulletin*, Nov. 1941.

system, it is desirable to make the meaning of one or two terms clear. In the first place, what is a tax? A tax is a compulsory contribution to public authorities for public purposes. It has been held that there is an absence of a direct *quid pro quo* between the taxpayer and the public authority. In recent years with the development of social security legislation there have been payments out of which the citizen cannot contract. It is preferable to classify such payments as taxes even if the proceeds are kept in a separate fund. Under the United States Social Security Act, 1935, these are termed "pay-roll" taxes earmarked for old-age and unemployment benefits. The Federal old-age benefit tax is 2 per cent of the pay-roll, one-half being added to the employer's costs and one-half being deducted from the worker's wage. The unemployment benefit tax is a combined Federal and State levy of 3 per cent of pay-rolls; in some States it is slightly higher and it is one of the most prolific of all Federal and State taxes. Indeed the Government has in recent years actually been borrowing from this source for other purposes. Licences, fees, conscience money and prices have also been included in the tax structures. Licences, such as licences for motors, usually more than cover the cost of service and are rightly regarded as a productive tax. Fees which are for governmental services and prices for services of a public utility should also be included. The net profits of public utilities and gifts to Government, which are often deferred payments as in the case of conscience money, are also included. Fines and the revenue from education and other services are usually deducted from expenditure and the net figure of expenditure shown.

The expressions "progressive taxes", "regressive taxes" and "degressive taxes" also require definition. Progressive taxes are taxes which take a larger percentage of a high income than of a low income, and in discussions on tax justice are regarded as the ideal taxes. We have moved a considerable distance away from the English Classical Economists who held that progressive taxation would arrest the expansion of industry because the rate of progression would increase until no motive remained to the individual to expand industry. Was it not J. S. Mill who held "to tax the larger incomes at a higher percentage than the smaller is to lay a tax on industry and economy"? There is no real basis for this fear when the progressive principle is not allowed to increase to the point at which it might imperil the accumulation of capital and industry. Mill preferred a proportionate tax, a tax taking the same percentage of all incomes. But with the rediscovery of progressive taxation in the present century and with the increased demands of the State for means to pay for the social services, especially education, unemployment relief and public health, a tax system without a good "dose" of progression is held to be

unsatisfactory from the viewpoint of tax justice. Although Adam Smith, 167 years ago, said that taxpayers should contribute "as nearly as possible in proportion to their respective abilities, that is, in proportion to the revenue which they respectively enjoy under the protection of the State", he stated what is often forgotten in the same book (Book V) of *The Wealth of Nations*, that "it is not very unreasonable that the rich should contribute to the public expense, not only in proportion to their revenue, but something more than in that proportion".¹ Taxes should be raised with the equality of sacrifice in view, and with progressive taxes well represented in the tax structure the system is held to be far more satisfactory than would otherwise have been the case. Least aggregate sacrifice to the citizens of a country is then possible, the main progressive taxes being the personal income tax and succession duties. The less the aggregate sacrifice, the better the tax system. In ordinary times, Governments in taxing aim at the maximum aggregate welfare. They aim at raising the standard of living as high as possible. In war-time they compress it in order that man-power and materials may be diverted to the winning of the war which, from the long-term point of view, may also be regarded as the maximum aggregate welfare. The least aggregate sacrifice means the taxing of those incomes which have the lowest marginal utility but not in a way to check the accumulation of wealth or to impede industry. While this is the sovereign principle of taxation it requires in practice to be limited.

The development of the marginal theory of value has affected the theory of taxation and it is clear that the hurt or sacrifice involved in taking a unit from a large income is not so great as taking the same unit from a small income. Whether or not we challenge the diminishing utility basis of progressive taxation, we all recognise that progressive taxation is a great engine for social improvement. In progressive taxation it is not infrequently noticed that large incomes are taxed at a higher rate than smaller ones, but not in a degree which involves so great a sacrifice as in the lower incomes. Such taxes are degressive.

It is one of the cardinal principles of tax justice that taxes should be direct rather than indirect. At first this classification was considered for the tax structure of those Federal countries analysed in the following chapters, especially as the distinction between direct and indirect taxes is well known and has even been enshrined in some of the Federal Constitutions themselves. This, however, has been the cause, as in Canada,² of much contention between the Centre and the units as regards taxing

¹ *The Wealth of Nations*, Book V, ed. Cannan, vol. ii, p. 327.

² *Vide* chap. ix (The Constitution To-day), Book I, of the Report of the Royal Commission on Dominion-Provincial Relations.

powers. Mr. Gladstone, it will be remembered, spoke of direct and indirect taxation as two attractive sisters introduced into the gay world of London, each with an ample fortune and both having the same parentage — Necessity and Invention — differing only as sisters may differ, where one is of lighter and another of darker complexion, or where there is some variety of manner, the one being more free and open and the other somewhat more shy, retiring and insinuating. “I cannot”, he added, “conceive any reason why there should be any unfriendly rivalry between the admirers of these two damsels; and I frankly own, whether it be due to a lax sense of moral obligation or not, that as a Chancellor of the Exchequer, if not as a Member of this House, I have always thought it not only allowable but even an act of duty to pay my addresses to them both. I am, therefore, as between direct and indirect taxation perfectly impartial.”¹

But what is a direct tax? J. S. Mill, whom lawyers in this connexion have usually quoted, defined a direct tax as “demanded from the very persons who, it is intended or desired, should pay it”, and an indirect tax as one “demanded from one person in the expectation and intention that he shall indemnify himself at the expense of another”.² The intention is doubtless that of the legislator, but the intention of the legislator does not always fit in with the actual facts. In the British income tax under Schedule A the tax on the landlord’s income from the ownership of land and buildings is collected by statute from the occupier of the land or buildings although it is legally imposed on the landlord. The tax is deducted by the occupier from the rental due to the landlord, any contract not to deduct it being legally void. According to Mill’s definition this tax would be indirect, but it is really direct. The fact that the distinction between direct and indirect taxes is so closely related to the problem of incidence has led some writers to overlook the difficulty of precise definition as we can only partially succeed in making the burden of both groups of taxes fall where we desire. The burden may be transferred to other persons when it is intended to remain where it is at first imposed, and when it is intended to be transferred the transfer may be tardy or partial. In short, the intention of the legislator is not a sufficient criterion for the distinction between direct and indirect taxes. Some would regard direct taxes as those which are not shifted at all and those which are shifted legally, and indirect taxes as those which are shifted quickly through commercial competition among consumers. (On the Continent direct taxes are those for which the taxpayer’s names are entered on a register giving the basis of assessment and the amount due. In this case the division between direct

¹ Financial Statement, 1861. Hansard, vol. clxii, p. 584.

² *Principles*, Book V, chap. iii, para. 1.

and indirect taxes rests on the mode of collection and not with the incidence of the tax. Another classification is to regard all taxes which are levied immediately on the property and income of persons and those which are paid by the consumers to the State direct as direct taxes, and to regard all other taxes as indirect. A classification, therefore, of a revenue system into (1) tax revenue, (a) direct taxes and (b) indirect taxes; and (2) non-tax revenue, (a) Government or public undertakings, (b) social services and (c) other sources, would be possible. No simple classification is possible without the danger of serious omissions and inaccurate inferences. Careful definition and interpretation are required in the study of each Federation, and provided this caveat is remembered this classification is not unsatisfactory. Its weak point is that it does not avoid, according to the League of Nations, the classical nomenclature of direct and indirect taxation, and thus a "terminology which might induce the reader to believe that it was employed in the particular manner customary in his own country when such, in fact, may not be the case".

We prefer, however, to keep to the classical nomenclature of direct and indirect taxation after stating the pitfalls in the use of the term. For reasons explained below, one of the main groups adopted in the classification of the tax structures of the countries concerned is mainly "direct". A direct tax, as we have seen, is one which falls where it is intended to fall, and an indirect tax one whose final impact does not necessarily fall where it is considered that it should fall. The burden of indirect taxation is concealed. The Government which levies the tax escapes the criticism of the burden.

On what basis, then, should we judge a tax system? If tax justice is to be the touchstone it should possess the characteristics of equality, certainty, convenience of payment and economy in collection. The principle of equality is indeed a standard to which every sound tax system must conform. Adam Smith states that "The subjects of every state ought to contribute towards the support of the government; as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state", and when he writes as above that "it is not very unreasonable that the rich should contribute to the public expense, not only in proportion to their revenue, but something more than in that proportion", he was more than a century ahead of his time. The meaning of equality has varied at different times in the history of financial doctrine, but it cannot be denied to-day that it underlies the accepted test — the ability to pay. If carefully analysed, it indicates progressive taxation. Equal taxes do not impose equal burdens, and in the measurement of ability we look not to the attitude which the taxpayer has, but rather to that

which he ought to have, *i.e.* we look to the attitude of society in regard to the sacrifice rather than to that of the taxpayer. We know that for the generality of people the test of ability is the size of income, and the taxable capacity of the individual rises more in proportion to the income, the higher the income. As a result, the progressive income tax is regarded as the fairest of taxes. It rises with the size of income, it allows to some degree for personal needs through abatements and allowance, *e.g.* on account of the size of the family or the personal exemption. It is true that the tax is intricate, but this is due to the attempt to secure tax justice at the cost of simplicity. All things considered, it is the tax that most nearly conforms to the standard of tax-paying ability. Death duties are also acceptable from the standpoint of ability to pay, whether the burden is on the deceased or on the successor. The excess profits tax if developed with care may also be regarded as the best method of recapturing war or monopoly profits that have escaped other controls. The canon of convenience, much stressed by American writers, is like the canon of economy, applicable in the long run to taxes as a whole. Productiveness is a very important factor and is often regarded as the main characteristic of a good tax. Among other characteristics of a good revenue system are elasticity, flexibility, simplicity and diversity. In recent years considerable emphasis has been laid on the taxation of surplus rather than on costs of production, and a good tax system should be one in which the taxation of surplus, *i.e.* of income in excess of that necessary for subsistence, is more important than taxation falling on costs, as, for example, taxes on consumption which are highly regressive. Taxes on costs include taxes on businessés without reference to their net incomes, and consumption taxes are those which affect the cost of living, wages and, ultimately, all costs of production. In times of depression there is a tendency to increase taxes on costs and thereby to weaken competitive power abroad and to increase the difficulties of adjustment at home. Taxes, in short, which lead to an increase in production costs restrict the national income as a general rule. They eliminate firms or even industries by destroying the margin of profit which has kept them in existence. The struggling or marginal firms, owing to the falling-off of consumption consequent on taxes on their costs of production, find they cannot make profits and tend to disappear. Investment, too, will be affected. "The result of the tendency of marginal firms to disappear and of the tendency of potential investors to refrain from engaging in new enterprises is that both labour and capital resources will be thrown out of employment and that the national income will be correspondingly diminished. Out of this diminished national income a larger revenue than before will have to be raised, as the unemployed will have to be maintained at the public cost. If, in order to raise the larger

revenue, new taxes are imposed which bear on costs, the vicious circle will be completed.”¹

Before we leave the problem of an equitable or fair tax system under a Federal Constitution it is necessary to emphasise its importance not merely from the point of view of particular taxes but as between different regions. This is seen by comparing the total taxes, Central, Provincial or State, and Local, paid in each unit. This may be expressed as a percentage of the total income of the area concerned or of the total income less the cost of subsistence. If progressive taxes are levied by the Central Government, for example personal income taxes and succession duties, and adjustment grants paid to the Provinces or States in accordance with their needs, it may be possible to avoid the territorial inequalities and to provide normal educational and other social and also developmental services without recourse to heavy taxation and to types of taxation which in the long run would nullify the purpose of such adjustment grants.

For the reasons stated in the previous paragraphs, we have decided to classify the tax systems in Chapters III to VII (inclusive) on a uniform basis in an endeavour to bring out the characteristics of a good revenue system. We have grouped the taxes into four groups : in the first group are the main progressive taxes — the personal income tax and succession duties. The taxes in this group are direct. In the second group are to be found the taxes on property. Property taxes in all Federations are an important source of revenue, especially for Local Authorities. The incidence of property taxes is somewhat complicated. It is not possible to classify these taxes as direct or indirect, or as progressive or regressive without considerable explanation. On the whole, we are of opinion that the best method is to show property taxes as a group by themselves. As this group includes taxes on buildings as well as on land, there are in it taxes on consumption in addition to taxes on scarcity values. There is, in fact, no clear-cut division of property taxes, but it is the best possible for purposes of comparison. The third group consists of taxes on business which are sometimes levied on surplus and sometimes on costs. Where these are on net income, they are on surplus and fall on the shareholders ; where they are fixed taxes, they are on consumption, although under certain conditions and for short periods they may be absorbed by the producers. Group four contains taxes on commodities. These are taxes on costs and are normally paid by consumers. The classification of taxes can never be perfect for all purposes. Sometimes a progressive tax may contain elements of regression, and consumption taxes elements of progression. The classification adopted, however, is on balance the one

¹ Report of the Royal Commission on Dominion-Provincial Relations (in Canada), Book II, chap. viii, p. 151.

which brings out most satisfactorily the characteristics of the revenue systems of the selected countries.

Public expenditures are closely related to public revenues and the methods followed in regard to the spending of the proceeds of taxes has much to do with their effect on the national income. We have accordingly classified these expenditures to bring out the character and costs of government. No classification is always satisfactory, because it depends to a great extent on the object which we have in view. We shall consider the nature and relation of Central or Federal, State or Provincial, and Local expenditures to each other. The two main classes of public expenditures may be divided into primary and secondary. Primary expenditures include all expenditure which Governments are obliged to undertake above everything else, *e.g.* on defence, law and order, general administration and the payment of debts. Secondary expenditures include social expenditure, developmental expenditure or public undertakings and miscellaneous expenditure. In recent years, especially since the great depression of 1929-32, social security expenditure has been of considerable importance, particularly as affecting the financial relations of the Federal, State or Provincial and Local Authorities. Not only is the expenditure on the social services of great importance from the distributive viewpoint but it is advantageous from the standpoint of industrial efficiency as well as from that of social justice and general good. Under developmental expenditures are included expenditures of a quasi-commercial or quasi-industrial nature such as those on railways, roads, canals, irrigation and other public works, posts and telegraphs, and subsidies for agricultural and industrial research. In effect, developmental expenditures tend to promote economic development. Lastly, there are subsidies and other grants and contributions, most of which represent transfers between different layers of government. This classification makes possible an analysis of the increasing cost of government and shows the direction from which it is taking place.

In recent years the borrowing policy of Governments in a Federation has become of great importance as showing the close interrelation of borrowing with regard to the social services, especially education and unemployment relief, developmental expenditures such as those on railways and roads, general financial and monetary policy and the control of the foreign exchanges. The importance of borrowing policy shows the desirability, if not the necessity, of a uniform policy between the Federal Government and units. Municipal indebtedness also is linked up with Provincial indebtedness, although to a much lesser extent. In Australia and in India, for example, the Federal Government has concatenated the borrowing of the units as well as its own borrowings, and the Dominion Government in

Canada has proposed to the State Governments the assumption of Provincial debts. This proposal would strengthen Canadian credit by removing the danger of Provincial default. It would remove the burden of debt from the people who dwell in the areas incapable of bearing it, and it would ensure a considerable saving when refunding becomes necessary.¹

After an analysis of the tax structures and public expenditures of the five Federations studied it will be necessary to examine very briefly the general problem of intergovernmental financial relations with special reference to the conflicts between the Federal Government and the States or Provinces and between the latter and the Local Authorities. There are also the conflicts between Federal and Local Authorities, between States and States and between Federal Government and countries abroad. As long as there are Federations there will be irreconcilable conflicts, and the most that can be hoped for is a series of beautiful compromises. There are, it should be remembered, various overlapping taxing authorities and communities are burdened with several layers of government. This means competition for revenues between Federal and State and between State and Local Governments. In recent years there is a tendency for the higher layer of government to use its taxing powers to control the lower layers. "Although there is a more or less traditional assignment of functions", says Seligman,² "to the various agencies local, state and federal, the shifting basis of economic life is gradually bringing about some alteration. This change is especially noticeable as between State and Local Governments. Recent decades have witnessed a decided drift towards centralisation, partly for administrative, partly for economic reasons." Among the problems arising are the realignment of governmental functions consequent on the changes just referred to. There are also the devices of separation, co-operation, of sharing or the division of yield, of supplements or additions, of grants and of the ingenious plan of credits which in the United States has been used with success for succession or estate and pay-roll taxes by the Federal Government. The sphere of intergovernmental financial relations also extends, first, to specific taxes and, secondly, to specific functions such as expenditures on the social services and on development.

CHAPTER III

THE PUBLIC FINANCE AND NATIONAL ECONOMY OF THE UNITED STATES

FEDERAL finance in the United States cannot be understood without a study of the country's national economy and of her Constitution. The country is the richest in the world, and this gives her a place of high importance in the economy of nations. Her Constitution, as Gladstone well described it in the *North American Review* in 1879, is "the most wonderful work ever struck off at a given time by the brain and purpose of man". This does not mean that the Fathers of the Constitution had achieved finality. The master spirit of the Philadelphia Convention, Alexander Hamilton, set his reliance not upon the document, but upon the "general genius of the Government", for, as he said, "particular provisions, though not altogether useless, have far less virtue and efficacy than are commonly ascribed to them". Thomas Jefferson, the third President of the United States, also held this view when he said that the Constitution should be "handed on, with periodical repairs, from generation to generation". The revolutionary changes that have taken place in the field of American public finance, Federal, State and Local, in the present century can be understood only after an examination of these two great factors. It is proposed to examine each of them in turn.

I. THE NATIONAL ECONOMY

The United States is the richest and strongest of the countries of the world. In size it is greater than the whole of Europe (excluding the U.S.S.R.), although it has but one-third of Europe's population. It is just over 3 million square miles in area and has a population of 132 millions. The United States of Brazil has a larger area (3·3 million square miles) but it has a population of only 43·3 millions. Canada has an area of 3·7 million square miles and is therefore larger than the United States, but it has a population of only 10·4 millions. The United States has 7 per cent of the world's population, but her production of primary and secondary industry is unparalleled. In natural resources — land, forests, minerals and natural power — she once found the main basis of her economic strength; but this is no longer so owing partly to the exploitation of her resources, but chiefly because of the very rapid advance of her manufacturing industry. Many are still apt to think of American economy

in terms of the nineteenth century when agriculture was supreme, but agriculture and forestry in the twentieth century have had to give way to the remarkably high production of manufacturing industry.¹ Her mineral resources, too, are greater than those of any similar area in the world, and together with the British Commonwealth she has two-thirds of the world's mineral output. Her output, however, is small in comparison with manufactures and trade. Of eight out of the eighteen major metals she is the world's greatest producer. The character and strength of her population are of great importance. From 1820 to 1940, 38.3 millions of alien immigrants landed in the country, and before 1914 immigration sometimes reached the figure of a million a year. The war of 1914-18 led to the spectre of hyphenisation — of immigrants who, it was feared, did not become completely American citizens in outlook, and laws were passed by Congress restricting immigrants from certain countries. Quotas were first fixed on the basis of the Census of 1910, then of 1890, and, finally, on a figure which was said to represent the make-up of the population of 1790. Not only was the stream of immigration greatly curtailed but its character was changed, the "old" immigration whose predominance it was desired to preserve being mainly from North-west Europe, and Protestant. This restriction of immigration was the natural companion of high tariffs, and it was believed that with a predominantly North-west European strain assimilation of immigrants with the main population, especially in the more populous areas, would be less difficult. From the labour viewpoint trade union organisation would be far easier. In the fiscal year ended 30th June, 1940, 70,756 immigrant and 138,032 non-immigrant aliens were admitted, a total of 208,788, while 21,461 emigrant and 144,703 non-emigrant aliens departed, a total of 166,164. The net increase, therefore, for the year was 42,624. The foreign-born population of the United States to-day is 13.4 millions, of which 1.8 millions are Italians, 1.6 millions Germans, 1.3 millions Poles and 1.2 millions Russians. Norway, Sweden and the Netherlands together account for 1.1 millions. The foreign-born British population is 2.1 millions, of which 745,000 are Irish. When the size of the country and also the variety of the racial origins of the people are remembered, the unity of the people, whose common language is English, is very remarkable. There are several factors such as transportation and the press, which strengthen this unity. The American railway system is the largest in the world, and air communications are more developed than in most countries, New York, Chicago, San Francisco and other great cities being within easy reach of each other. There are nearly 1900 daily newspapers, and

¹ See Tables 18 and 19 in Part III for the distribution of the national income by industries in recent years.

40 million copies are sold daily, one newspaper for every 3·3 inhabitants. Education is also at a high level with over 26 million children in elementary public schools, 7 millions in high schools and 1·4 millions in universities. The education is such that all classes of children, rich and poor, are educated together in their early years, and in a democracy this is a unifying factor not without considerable social value.

Whereas the first characteristic of the national economy is unity over this vast continent, the second characteristic is the great differences between different areas, differences of climate, geography and, therefore, of production. This is illustrated in Chart III on p. 24. The North-eastern States differ from the Middle West States and the Middle West States from the Mountain and Great Plain States. The North-west Pacific States are also a region by themselves, as are the South-eastern States, the South-western States and California. It is difficult to delimit these groups with accuracy, and often historical accident makes even one part of a State differ from another, as, for example, Northern Ohio from Southern Ohio. These groups of States are more or less homogeneous from the economic point of view, and this has the result of cutting across State boundaries. "Sectionalism — the habit of working as one political unit — is thus imposed by a variety of forces on groups of states, and the legal units, the States, are only convenient weapons for the sections to use in the endless battle of pressure groups for the favour of the Government of the United States. It is these six or seven sections, not the forty-eight States, that are the realities underlying the American federal structure, the internal obstacles to the more perfect union promised by the preamble to the Constitution."¹ Another point which reinforces sectionalism is the locality rule by which every senator and representative must be a resident of the State he represents, and this excludes from Congress men whose party is in the minority locally. They cannot be candidates elsewhere and cannot be elected at home. The Minority, because of the constitutional proviso, accordingly looks to senators and representatives of other States. Every State regardless of its population has two senators, so that Nevada with a population of 100,000 has the same representation in the Senate (but not in the House of Representatives) as New York with 12,000,000.² Points of view in States not represented or ill represented in the Senate frequently find their spokesmen from Western States.

The national income is a measurement of potential economic strength

¹ D. W. Brogan, *U.S.A. · An Outline of the Country, its People and Institutions*, Oxford University Press, 1941, p. 12.

² This over-representation of area accounts for the importance of the "Silver" States in the Senate and explains the importance of silver in American financial policy.

which in turn depends on the interplay of the factors of production (natural resources, labour including the number and character of the population, capital and entrepreneurship or organisation) on each other. The total income is the largest in the world and before the present war was three times that of Great Britain, and equal to that of Great Britain, Germany and Russia combined. The figure for 1938 per head at factor cost was £105 (\$508) as compared with £97 (\$469) in Great Britain. In 1941 the corresponding figures were £186 (\$749) and £133 (\$534). The average *per capita* income in the United States is about one-fifth more than that in Great Britain. The American income is much more expansible and variable than that of Great Britain. For example, the United States increased its production from 23 to 29 per cent between 1939 and 1941¹ while Great Britain increased its production by 12½ per cent between 1938 and 1941. The United States to-day has a substantial margin of increase still to be absorbed in the war effort while in Great Britain 1943 should see the ceiling reached. The Census Bureau reported that employment in the United States reached the record total of 54,300,000 during the week ended 10th July 1943, a figure which is entirely confined to civilians and excludes the armed services. In August 1943 the United States was producing about 60 per cent of the United Nations' output of munitions as compared with 17 per cent for the United Kingdom, 5 per cent for the rest of the Commonwealth and Empire (of which the greater part came from Canada) and 18 per cent for Soviet Russia and the other United Nations. So great has been the increase in production in the United States since the war effort began three years ago that in the current year ending 30th June 1944 the national income will be \$150,000 millions. If the figure per occupied person is taken for 1937, the *per capita* income is £256 for the United States and £232 for Great Britain. If the fully employed worker only is taken, the value of goods and services he produced in 1937 was about £340 in the United States and £260 in Great Britain. The diagram on page 21 shows the size of average incomes in the two countries and is from *America's Economic Strength*, by C. J. Hitch.²

The average income per occupied person is greater in the U.S.A. than in Great Britain. If we compare wage rates, the difference is very much greater; in 1930 they were almost twice as high as in Great Britain. In 1929 the U.S.A. income per occupied person was £300, but in the depth of

¹ Cf. Mr. R. Stone's paper on "The National Income, Output and Expenditure of the U.S.A., 1929-41" (*Economic Journal*, June-Sept. 1942): cf. *Economist*, 5th Sept. 1942; "On the average of years, however, it seems probable that the average British income lies somewhere between three-quarters and seven-eighths of the American — 80 per cent might be a fair average figure to take for *prima facie* comparisons".

² C. J. Hitch, *America's Economic Strength*, Oxford University Press, 1941, p. 22.

the great depression it fell to £170 (in 1932), and rose to £256 in 1937.¹ The difference between the two countries in *per capita* national income, *i.e.* total national income divided by total population, is much less than as between occupied persons, because the United States, unlike this country, had in 1937 a large rural population of which the unemployed and impoverished were no small part. In that year farmers were 23 per cent of the total occupied population, but the country produced a greater agricultural output than any other country in the world. This 23 per cent received only 15 per cent of the national income, agriculture being, as

CHART I

AVERAGE INCOMES IN THE UNITED STATES AS COMPARED WITH THOSE IN GREAT BRITAIN

compared with services and manufacturing industry, the least gainful. In 1820 agriculture employed 70 per cent of the population and 54 per cent in 1870. Land is less fertile in proportion to the population than it was, and antiquated methods of farming still obtain: in some regions, as in the "Old South" and the western part of the Great Plains, the returns are poor. The South, with half the total farming population, produces only 30 per cent of the farm incomes as contrasted with the Middle West, where 33 per cent of the farming population lives but produces 40 per cent of the income, efficiency in agriculture in the Middle West being comparatively high. In California agricultural production is the highest in the world²;

¹ Mr. R. Stone (*op. cit.*) gives the net national income of the U.S.A. at factor cost as follows: \$87.6 billions in 1929 and \$42.8 billions in 1932; \$72.6 billions in 1937 and \$99.1 billions in 1941.

² California's productive power is truly remarkable. Not only does the State possess a most valuable specialised agriculture, particularly fruits and vegetables, but in industry records are being broken. In 1943 in Los Angeles county alone, aeroplane production was double Germany's and four times Japan's. The shipbuilding industry in the State is greater at the moment than in the rest of the world. (Cf. *Economist*, 18th Dec. 1943, p. 810.)

the *per capita* farm income is four times the American average. In the United States as a whole agricultural output has greatly increased in the present century. The increase is estimated at 50 per cent between 1900 and 1930. On the other hand, agriculture in the United States is not as productive per man engaged in that occupation as it is in New Zealand, Australia and the Argentine, where there is a proportionately large meat production. It is more or less on a level with Danish agriculture and somewhat more productive than that of Great Britain, the Netherlands and Germany.¹ The explanation of the high American national income² is not to be sought in agricultural production but in the high production of manufacturing industry which employs 25 per cent of the occupied population, and in the high proportion of those engaged in distributive and other services — 50 per cent. Owing to the large amount of capital employed, the large scale on which production is conducted and the great progress in technique in recent years, the output of secondary industry is several times greater than that of Great Britain, although the numbers engaged in the United States are less than twice as great as those employed in Great Britain. Two important facts of the national economy must not be forgotten — first, the contrast between the average income by occupations and, secondly, the contrast between regions in the United States. These are well brought out in Mr. Hitch's two diagrams (Charts I and II).

The national motto, *E Pluribus Unum*, in spite of the diversities shown in the two following diagrams, holds good not merely on account of the abundant natural resources of the continent (developed long before those in South America or in the self-governing Dominions) and the high efficiency in manufacturing industry (an efficiency, especially in labour, without equal in the world) but also on account of non-economic factors. Great importance must be given to the union brought about in 1787, which is a living influence at the present time after more than a century and a half of history behind it. It is usual to describe the United States as "the greatest free trade area in the world". Section 9 of Article I of the Constitution provides that "No tax or duty shall be laid on articles exported from any State. No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to, or from, one State, be obliged to enter, clear, or pay duties in another." The great iron ore exports, for example, in northern Minnesota are shipped from Duluth through the Great Lakes to

¹ C. J. Hitch, *op. cit.* p. 34. The estimates have been checked. In making comparisons care must be taken to compare net production figures. It is sometimes forgotten that British agriculture has to import considerable amounts of feeding stuffs which have to be allowed for in estimating net output.

² See Tables 18 and 19 in Part III.

the blast-furnaces of the Eastern States. Coal is sent from Pennsylvania to Duluth in the same ships. Los Angeles is able to get its supply of water from the Sierra Nevada and the Colorado River. Crude oil is pumped from one State to another where it is broken up into petrol or gasoline, kerosene and lubricating oils, and sold to the industries of the New England States. This absence of tariff barriers has led to a considerable degree of specialisation in agriculture. One region is complementary to another, and this makes for economic strength. "Without unity the North-east would be an England, the South-east a Poland, the Middle

CHART II

AVERAGE INCOME BY OCCUPATIONS IN THE UNITED STATES IN 1935

Note—The earnings of fully employed persons are represented by the height of the columns.

West a Germany, and the Far West a Siberia. That this has not happened is due to two events which occurred at the end of the eighteenth century ; one primary, the adoption of the Federal Constitution ; the second subsidiary, the inclusion in that constitution of an economic clause entrusting the Federal Government with the regulation of interstate commerce, and forbidding the States to levy tariffs on it. The Federal Government's regulation has, for the most part, taken the form of active encouragement : it subsidised the early railways by grants of land, and has spent large sums in the improvement of through highways and the development of air transport. The Federal Constitution succeeded in creating the greatest area of free trade in the world, in which an extensive,

if not perfect, division of labour enabled each region and each state to specialise in the production of the goods which it was best suited to make, and which made possible the utilisation of the nation's capital for the efficient manufacture of commodities on a mass production scale."¹ Especially since the great depression of the early thirties attempts have been made to circumvent the Federal Constitution in regard to internal

CHART III

AVERAGE INCOME PER OCCUPIED PERSON BY REGIONS IN 1937

Notes.—The North-eastern States are Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, (District of Columbia) and West Virginia.

The Pacific North-western States are Washington, Oregon and Idaho.

The Middle States are Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa and Missouri.

The Mountain and Great Plain States are North Dakota, South Dakota, Nebraska, Kansas, Montana, Wyoming, Colorado, Utah and Nevada.

The South-western States are Oklahoma, Texas, New Mexico and Arizona.

The South-eastern States are Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas and Louisiana.

free trade. The inspection of agricultural products at State boundaries under the guise of preventing plant disease or of protecting a pure milk supply or of inspecting and taxing road vehicles has been a trade barrier with which the Supreme Court has been unwilling to interfere. The effect of all these measures has not been great.

A country with so pre-eminently strong a national economy as the United States must necessarily have an important place in international economy. In international trade the United States has the second place,

¹ C. J. Hitch, *op. cit.* p. 31.

the United Kingdom taking the first place. The exports of primary industry — agricultural products and raw materials — were in 1937 not quite a quarter of the total exports as compared with 75 per cent, the average in the second half of the nineteenth century. The remaining three-quarters were manufactured or semi-manufactured goods, mainly machinery of all kinds, motor cars, aircraft (especially since the war), iron and steel, raw cotton, petroleum and oil, and chemicals. Imports have also changed. Raw materials and articles of food (not produced or only produced in relatively small quantities) such as crude rubber, pulpwood and products, cane sugar, coffee, vegetable oils, raw silk, wool, tin and chemicals are now the main imports and not manufactured goods. Exports are a fraction of total production, about 5 per cent. In recent years the direction of trade has been changing; the percentage of foreign trade with Europe has been declining in favour of Asia, South America and Africa. But in 1937 Europe (including the whole of the U.S.S.R.) still took 41 per cent of American exports, though it supplied only 27 per cent of its imports. Since the war of 1914–18 the United States has become a creditor country. But she has not behaved as a creditor country, viz. by importing more than she exports, or making loans rather than by importing gold. She has imported gold since the defaults of the thirties, which has been an expensive policy to the American Treasury and to the country as a whole. As a shipping country she holds the second place after the United Kingdom, but in railway mileage she is easily first with a mileage of 248,000 miles.¹ The general conclusion from the international viewpoint is that the United States is not, like Canada, in a vulnerable position in international trade. She depends mainly on her home market. On the other hand, her natural resources are so great and her industrial production so efficient that Europe and other continents look to her for her products, but the exports of these products are a small part of her total production.

The United States Economy in War-Time

The most arresting fact of American economy in war-time is its great reserve of productive power. This is clearly seen in the increase in national income and in the increase in production. In the calendar year 1938 American national income at factor cost, i.e. excluding indirect taxation and subsidies, was \$66.1 billions²; in 1941 it was \$99.1 billions, an increase of 50 per cent. (At the end of 1942 it was of the order of \$125 billions.) Between 1938 and 1941 the British national income increased from £4595 millions to £6338 millions, an increase of 38 per cent. In

¹ Mileage operated by steam railways in 1939.

² United States billions (1000 millions); not the million millions as used in Great Britain.

1939-41 United States production rose between 23 and 29 per cent according to Mr. Stone's estimates in the *Economic Journal*,¹ as compared with 12½ per cent between 1938 and 1941 in Great Britain.² "This large increase in American output is mainly to be attributed to the comparatively low level of the employment of resources in that country even at times of 'good' trade. The level of unemployment has been high in the United States for many years, and average hours of work have been sufficiently low to allow a considerable rise in output through their increase. Thus, between 1939 and 1941 civil non-agricultural employment is estimated to have increased by some 4·3 millions, or 12 per cent, while in the latter year there were still some 4 million workers unemployed. Over the same period average weekly hours in factories increased by 2·9 hours per week, or nearly 8 per cent."³ Another factor is the lower proportion of men called up for military service. Increased output rather than diminished consumption and disinvestment accounted for the increase in national income in the United States since the war. In short, full economic mobilisation is still distant in the United States, whereas in 1943 this has been almost achieved in Great Britain. This greater elasticity in the American National Economy is reflected in the increase in Federal expenditures, which were as follows :

TABLE I

GOVERNMENT EXPENDITURES IN THE U.S.A. IN RECENT YEARS
(\$ billions)

	1938-39	1940-41	1941-42
Federal . . .	9·1	13·3	32·6
State and Local . .	10·5	10·0	11·0
	19·6	23·3	43·6

Source.—*Economist*, 24th Jan. 1942, p. 106.

The United States is indeed fortunate in being able to make a gigantic war effort with so little effect on present consumption or on its future wealth, a contrast with Great Britain. In ordinary years the United States *per capita* income is from 10 to 15 per cent higher than that of Great Britain, but it is very much more variable from year to year. At the present time it is 25 per cent greater.

The *Economist* has shown in the following table³ that in 1942-43 the Governments of the United States and of Great Britain will be spending

¹ *Economic Journal*, June-Sept. 1942, p. 169.

² N. Kaldor, "The 1941 White Paper on National Income and Expenditure", *Economic Journal*, June-Sept. 1942.

³ *Economist*, 5th Sept. 1942, p. 300.

roughly the same percentage of pre-war national income in each country, but the manner in which it is paid for is very different because of the very large increase in output that is still possible in the United States. This means that the expenditure can be met by reducing consumption to the pre-war level and by reducing by half the pre-war rate of additions to capital. In Great Britain, however, the increase has to be met by a considerable decrease in consumption and by a heavy inroad on capital.

TABLE II

DISTRIBUTION OF THE NATIONAL INCOME IN REAL TERMS

(Net national income of base year=100)

	Base Year		1940		1941		1942-43	
	U.S., 1939	U.K., 1938	U.S.	U.K.	U.S.	U.K.	U.S.	U.K.
Personal expenditure .	78	77½	82½	71½	88	69	76½	64
Government expenditure	17½	16	18½	49	26½	61	69	67
Net investment . . .	4¾	6½	8¾	-16½	11½	-19	2½	-17
Net national income at market prices . . .	100	100	109½	104	126	111	148	114

The figures in the table are approximate, but they show that in the pre-war years, both in the American and British economies, there were no great differences in the distribution of expenditure between consumers' expenditures, Government expenditure and net investment. The changes in 1940, 1941 and 1942-43 are very noticeable. The *Economist*, on the assumption that the cost of the war measures the increase in Government expenditures, distributes the increase as follows, the figures being — like the totals in the table above — percentages of the net national income in the base year :

TABLE III

DISTRIBUTION OF THE INCREASE IN GOVERNMENT EXPENDITURES, 1942-43

	U.S.A.	U.K.
From increased output . . .	48	14
From diminished consumption .	1½	13½
From reduction in net investment (or from drafts on capital)	2¼	23½
	51¾	51

Economic strength, in the sense of capacity to produce goods and services, is the equivalent of a country's war potential, and the United

States possesses a military potential not far short of the whole of the continent of Europe. But for a short period the United States is vulnerable because, unlike Germany, she is not armed to the teeth. She therefore has to swing over in the shortest possible time to a planned long-period war economy, and that is what the N.D.A.C. (the National Defence Advisory Commission) is doing. This has its financial implications, especially in the sphere of Federal finance. This swing-over from peace to war has been noticeable in a special degree since the third quarter of 1941. Mr. Stone has shown that, assuming the net national income of the United States at factor cost (*i.e.* the current value of goods and services produced by the factors of production before indirect taxation) = 1, then—

II. THE CONSTITUTION

The United States is governed in accordance with a written constitution, interpreted by the Supreme Court. The Supreme Court of nine judges interprets the Constitution in the light of what it calls "the rule of reason", and this means in effect what the majority of five thinks reasonable. It gives not merely a legal but a political or philosophical meaning to its decisions, and, be it noted, it has no hesitation in changing its opinions. The reversal of previous decisions, particularly since 1937, has been of great constitutional importance, especially from the viewpoint of financial relations. The meaning, for example, of the "due process of law" in the Fourteenth Amendment given in 1935 in *Colgate v. Harvey*¹ was reversed in 1940 in *Madden v. Kentucky*² when the Supreme Court found the 1935 decision "repugnant", and declared that it "must be and is overruled". The decisions in *Adkins v. Children's Hospital*³ in 1923 and the *Tipaldo* case⁴ in 1936 were reversed in 1937 when the Court

¹ *Colgate v. Harvey*, 296 U.S. 404.

² *Madden v. Kentucky*, 309 U.S. 83, 93.

³ *Adkins v. Children's Hospital*, 261 U.S. 525.

⁴ *Morehead v. New York ex. rel. Tipaldo*, 298 U.S. 587.

upheld the minimum wage law of the State of Washington¹ and repudiated the doctrine that used the due process clause to forbid minimum wage legislation generally. "The case of *Adkins v. Children's Hospital*", said the majority of the Court, "should be, and is, overruled." Even before changes in the Court's personnel took place which brought the number of Roosevelt appointees to seven in a Court of nine, the due process clauses of the Fifth and Fourteenth Amendments were no longer regarded as restraints on the legislative control of economic policy. The reversal of the Supreme Court's invalidation of the Congressional Acts relating to the New Deal, such as the National Recovery Act of 1933² in 1935 and the first Agricultural Adjustment Act³ in 1936, is well known, as is the upholding of the National Labor Relations Act in 1937 and the Fair Labor Standards (Wage and Hour) Act of 1938⁴ in 1941. Who would have anticipated so precipitous a change from the position taken up in 1935 and 1936 in the interpretation of the Constitution? The Supreme Court rightly stated in 1938 that "Mathematical or rigid formulas . . . are not provided by the great concepts of the Constitution, such as 'interstate commerce', 'due process' and 'equal protection'".⁵

The sections of the Constitution dealing with finance and with financial relations are these :

- (1) Representatives and direct taxes shall be apportioned among the several States which may be included within this Union, according to their respective numbers. (Art. I, Sect. 2.)
- (2) The Congress shall have power to lay and collect taxes, duties, imposts and excises, to pay the debts and provide for the common defence and general welfare of the United States ; but all duties, imposts and excises shall be uniform throughout the United States ;
To regulate commerce with foreign nations, and among the several States. (Art. I, Sect. 8.)
- (3) No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration, herein before directed to be taken.
No tax or duty shall be laid on articles exported from any State. (Art. I, Sect. 9.)
- (4) The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively or to the people. (Amendment X, 1791.)
- (5) No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States ; nor shall any State deprive any person of life, liberty, or property, without due

process of law ; nor deny to any person within its jurisdiction the equal protection of the laws. (Amendment XIV, 1868.)

- (6) The Congress shall have power to lay and collect taxes on incomes, from whatsoever source derived, without apportionment among the several States, and without regard to any census or enumeration. (Amendment XVI, 1913.)

Except for Amendments X, XIV and XVI above, the sections quoted are those drawn up in 1787 and brought into force on 30th April 1789 after ratification by eleven out of the thirteen original States. In the century and a half of its existence it has changed less than perhaps any other system of government in the world. It has, however, a very different meaning to President Roosevelt from any that could have been conceived by Alexander Hamilton. It is no mere antique symbol but a living influence upon the lives of Americans, as the history of the New Deal has shown.

In three directions it differs from the British Constitution, although both nations start from the same foundation — government by consent of the governed. In the first place it is not a Parliamentary system of government. Since the time of their first President, George Washington, the American people feel themselves represented primarily by their executive officer, the President, and by members of his Cabinet rather than by Congress. In 1868 in the clash between the Executive and the Legislature over the impeachment of President Andrew Johnson it was the Constitution and the loyalty of Americans to it that made the Executive supreme. A second difference from the British system, perhaps a unique feature of American polity, is the absence of that opposition between the Government and the industrial classes which has been traditional in Europe. The whole American social and political system is based on industrial property right, and American lawyers accordingly have held that the Fifth and Fourteenth Amendments apply to all "persons", real or fictitious, *i.e.* the corporate persons of industry have also their rights, the Supreme Court being the custodian of all American liberties, whether of individuals or of corporations or of cities or of States. A third contrast with the British system is the idea of federation, an idea subsequently adopted by Canada, Australia and South Africa. The Centre is the trustee of federation which will always be the central thread of American constitutional development. The gradual strengthening of the Central or Federal Government, as the Amendments to the original Constitution have shown, is the most characteristic development of the Constitution to-day. In no small degree this is due to the increased complexity and the increased cost of government. The States or the people have all those powers not delegated to the Federal authority, but they have to accept the

lead of the Centre even in activities in which they are nominally sovereign. As the New Deal has shown, a new federalism has sprung up which requires for its effectiveness¹ co-operation by the States in the form of legislation. Federal financial power has had powerful centralising influences in recent years, and the States have been willing partners in national action. This has been essential to ensure uniform or integrated action on common problems. In 1930 the Federal Government gave grants to States amounting to about \$150 millions to assist eleven different State activities. Nine years later the total was \$800 millions, and the number of assisted activities was twenty-one. Fifteen per cent of the total revenues of State Governments now comes from federal grants.² The Constitution links the spending power of Congress to general welfare, as in Section 8 of Article I — "The Congress shall have power to lay and collect taxes . . . to pay the debts and provide for the common defence and general welfare of the United States". The Supreme Court in 1938 declined to permit private utilities not operating under exclusive franchises to challenge the grants and loans of the Public Works Administration to municipal and other public electrical plants,³ and in 1939 went further and supported the Tennessee Valley Authority's contention that it was not merely within its rights in damming the bed of the river but in making contracts for the supply of power to neighbouring cities.⁴ Experience shows that in a federation the Federal Government must be in most cases the leader. A policy which takes into account the interests of all does not satisfy everybody. National or Federal interests and State interests do not invariably coincide. If they did, federation would be meaningless and unnecessary. The American Constitution was and is the embodiment of the idea of Union, the idea that the States of the Union in their own interest and although unequal in size and wealth must forgo their jealousies and transfer elements of their sovereignty to a central Government. The trend of judicial interpretation by the Supreme Court is in the direction of extending the powers at the Centre. John Marshall, Chief Justice of the United States from 1801 to 1835, was the first to erect the Constitution as a superior paramount law, and invoked the concept of political nationhood as against the rights of the States. Roosevelt, like Jackson, has used the Constitution to good purpose ever since he came into office, which was at a time when the United States was feeling the

results of the great depression more severely than any other country of the world. His aim was to cure, "under the framework and in the spirit and intent of the American Constitution", the causes of the great depression at a time of world-wide change, creating problems "for which the masters of the old practice and theory were unprepared". These causes were mainly the concentration of economic power in the hands of the few and the lack of investment. In spite of all that has been said and done, "We have", he said, "not weeded out the over-privileged, and we have not effectively lifted up the under-privileged". Social justice was a definite goal and he had no quarrel with the profit motive, which he defined as "the right to work to earn a decent livelihood for ourselves and our families". He declared, "Americans must forswear that conception of the acquisition of wealth which through excessive profits creates undue private power over private affairs, and, to our misfortune, over public affairs as well". That this was an accurate diagnosis of the facts was undoubtedly true. The diagram on p. 33 shows the catastrophic fall in the national income between 1929 and 1933, and the recovery from that year to 1937. There was a fall from 1937 to 1938 followed by a rise, so that at the end of 1941 the national income was larger than in 1929.

The concentration of economic power was clear from the fact that the proportion of the occupied population employed by others had risen from 50 per cent in 1870 to 80 per cent of the total occupied population in 1935. It was also seen in the unequal distribution of income and in the growth of large corporations. Three per cent of the population, according to one estimate, owned shares in 1929, and three-tenths of 1 per cent received 78 per cent of the dividends. In 1930 1 per cent of the corporations owned half the wealth of all corporations, and it was calculated that if the 200 largest grew as fast as they did in the 1920s they would have half the country's wealth by 1950. The decline in investment was due to several factors such as the slowing-down in the growth of population assisted by the decline in immigration, the completion of the railway system and similar means of investment, and the state of Europe making investment too risky.¹ President Roosevelt, therefore, set about the

¹ Cf. C. J. Hitch, *op. cit.* chap. v, "Depression and New Deal". Also Hansen, *Fiscal Policy and Business Cycles*, London: Allen & Unwin (New York: Norton & Co), 1941. Professor Hansen distinguishes between a circular-flow economy in which consumption and net income are equal and a dynamic economy where there is a constant tendency for consumption and net income to be unequal. A dynamic economy tends to run down like a clock and requires winding up repeatedly — by fresh opportunities for investment. This is the best book yet written on full employment as it affects the United States to-day. According to Professor Hansen, the decline in investment was caused not so much by the decline in the demand for consumption goods as such as by that in the demand for residential construction. In his view, the United States ceased to have an expanding economy, partly because the growth of population and immigration have declined, and monopoly and other factors have produced a rigid price structure which prevents the growth of

solution of these problems by legislation. In order to remedy the bad effects of the first factor, he tried to make the worker more secure and more powerful in bargaining with capital. To this class of measures belong the Social Security Act, the National Recovery Act, the Wagner Act and amending Acts, the Wages and Hours Act. He also assisted farmers by

CHART IV

NET NATIONAL INCOME, 1929-41

(Income of 1929 = 100)

Note —The net national income figures are those in Table I on p. 162 of Mr. Stone's article on "The National Income, Output and Expenditure of the U.S.A.", *Economic Journal*, June-Sept. 1942.

raising the prices of farm products. Legislation was passed to deal with the concentration of economic power, both industrial and financial, such as the reduction of regulated prices in certain industries in which corporations or large firms were dominant. Attempts were made to increase and stimulate investment by "pump-priming" the control of credit, and the construction of public works by the W.P.A. (Works Progress Administration) private investment. On the depression and the New Deal, as well as the general background, see also Allan Nevins and Henry Steele Commager, *America: The Story of a Free People*, Oxford University Press, 1942, especially pp. 408 ff.

tration) and the P.W.A. (Public Works Administration).

The war has brought rather different financial problems. On 7th September 1942 the President, in a message to Congress, bluntly told Congress that if it did not pass the necessary legislation to prevent inflation — the fixing of prices and wages and the increase in taxation — for which the Administration asked, he would be compelled to act himself on account of his inescapable responsibility to the people of the country. He had precedent for this. Abraham Lincoln on 1st January 1863 issued a proclamation emancipating slaves by virtue of his authority as Commander-in-Chief and as a necessary war measure, and in 1865 Congress ratified an amendment to the Constitution — the Thirteenth Amendment abolishing slavery. The action of President Roosevelt once more illustrates the elasticity of the Constitution and the dominating position of the Executive in taxation and other matters in recent years.¹ The legislation asked for by the President was duly passed by Congress, though with an amendment making some concessions to farm interests.

III. GOVERNMENT REVENUES AND EXPENDITURES

The increase in the cost of government in recent years and the consequent increase in taxation are set out in the table on opposite page.

As far as total Government revenues and expenditures are concerned, the fiscal year 1915 was the last comparatively normal pre-war year in the United States. Hence the first and third columns, which show the percentage increase in expenditures and tax collections, compare recent years with 1915. During the war period of 1917–18 expenditures and to a lesser extent tax revenues of all three layers of Government increased rapidly. In the case of State and Local Governments this increase continued during the 1920s. Federal expenditures (and hence taxation) were cut down considerably after the war — from \$18·5 billions in 1918–19 to \$3·5 billions in 1924–25. But even these “Coolidge economy” measures from 1923 to 1929 left the cost of the Federal Government at a level several times higher than it had been before the war, and from the middle 1920s onwards the upward trend began slowly to reassert itself. Then, in 1929 and 1930, came the great depression, and with it revolutionary changes in American public finance. National income in money terms fell by more than half (see Chart IV, p. 33). With the emergence of mass unemployment, the burden of relief fell at first on the Local Authorities. But soon these found themselves quite unable to cope with the situation. Their revenues were shrinking (in some cases there were even taxpayers’ strikes),

¹ Cf. W. B. Graves, “The Future of the American States”, *American Political Science Review*, vol. xxx, 1936, p. 24, where the dominance of the Federal Government in recent years is discussed.

Note.—Various statistics are available, especially for National and State figures ; but it is very difficult to get comparable figures for all three layers of government. For this reason we have taken Dr. Mabel Newcomer's figures for Expenditures and interpolated those for 1938 and extrapolated those for 1910, 1941 and 1942 (with the help of some official figures in the U. S. Statistical Abstract in the cases of 1910 and 1937, and that of figures given in the *Economist* for 1941 and 1942). Revenue figures are figures of *tax yields only* (excluding social insurance contributions) as published by the Tax Institute, University of Pennsylvania (figures for 1940, 1941 and 1942 extrapolated as for Expenditures). The percentage increases given are rounded figures, except in the cases of the percentage increases in Revenues in 1938 over 1915 and over 1930.

and they had to cut down expenditures accordingly. The State and National Governments had to come to their aid, and before long the responsibility for relief was largely taken over by the higher layers of Government, especially after the coming of the New Deal in 1933. The expenditures of the National Government doubled and trebled during the 1930s. Taxation was increased, but to a much lesser extent, partly because it would have been difficult to do more during the depression, partly for a more important reason. That reason is the New Deal policy of "pump-priming", that is attempting to stimulate recovery by investment in durable goods through continued large-scale deficit financing, which was not on a sufficient scale to restore activity to the spending levels of the 1920s. It has been suggested that amounts equal to at least three times the amounts in the Budget would have been required to restore activity. This is further illustrated by Table 21 in Part III. Then came the rearmament programme and the present war, which greatly reinforced the tendency of National Government expenditures to increase out of proportion either to revenues or to State and Local expenditures. Federal Government expenditures in 1937-38 were $7\frac{1}{2}$ times what they had been in 1914-15 and double those of 1929. By 1941-42 they were over $4\frac{1}{2}$ times as great as in 1937-38, and $32\frac{1}{2}$ times as great as in 1914-15, while the Budget for 1942-43 provides for an estimated expenditure of \$58.9 billions (of which \$52.8 billions is for defence), or nearly a sixty-fold increase over 1914-15! In August 1943 aggregate expenditure of the year which began on 1st July 1943 was estimated at \$106 billions. The increase in Federal tax revenues has been somewhat less spectacular since the depression; but even so, Federal tax revenues in 1937-38 were 883 per cent of the corresponding 1914-15 revenues and 147 per cent of those of 1929-30, while those of 1941-42 are over 19 times and those budgeted for 1942-43 (\$17.6 billions, including non-tax revenue) over 25 times as great as those in 1914-15. The increase during both wars has been associated with a rise in the relative importance of the income tax, though this feature was much more marked during the last war than it has been so far during this.

The proportionate increase in State expenditures and revenues between 1914-15 and 1937-38 was of a magnitude similar to that of the corresponding changes in the finances of the National Government. The percentage increase in expenditures between 1929-30 and 1937-38 was naturally somewhat less than that in Federal expenditures (70 per cent as compared with 100 per cent for Federal expenditures), but still very considerable. For, as we have seen, State Governments have participated in the movement of taking over from Local Governments and developing further such functions as relief. The system of unemployment insurance

introduced by the Social Security Act of 1935 is worked by Federal and State authorities together. The increases in State revenues and expenditures since the outbreak of war have naturally been much smaller than the corresponding changes in Federal figures.

As might be expected in these circumstances, the changes in Local Government revenues and expenditures have been far smaller than has been the case with the higher layers of Government. The figures never rose to much more than $2\frac{1}{2}$ times the level of 1914-15, and there was actually a slight decline, both in expenditures and revenues, after 1930-31. No very great changes in the Local totals seem to have been caused by the present war.

It is of interest to compare the statistics of Government expenditures and revenues in Table V with those of the national income (Table VI).

This table brings out even more clearly the features already noted, such as the gradual upward trend and the impact of wars and depressions. National Government figures vary much more than either State or Local ones, both in absolute terms and in terms of the national income. In the most recent years, when national income has increased rapidly as a result of rearmament and war expenditure, the ratio of Federal expenditures to the national income has naturally risen at a rapid rate, while the similar ratios relating to the more stable State and Local expenditures have fallen. As mentioned above, some of the changes due to the depression, the New Deal and the war are further illustrated by Table 21 in Part III.

Two more points should be noted in this connexion. In the first place, the burden of taxation and the weight of expenditure are rather heavier than in most of the other Federations studied in this Enquiry. In the year 1937-38, Government revenues in the United States from taxation alone amounted to the equivalent of 19 per cent and expenditures to 24 per cent of the national income.¹ This compares with 17 per cent in South Africa (total revenues only), 13 per cent in India (for both revenues and expenditures) and 25 per cent (for both revenues and expenditures) in Australia. Since the war the contrast has become even greater, especially in the field of expenditures, where the American percentage reached 27 in 1939-40 and approximately 41 in 1941-42. The Budget estimate for 1942-43 provides for an expenditure of something like 60 per cent of the national income (all Governments), though such figures should be used with caution as merely indicating the order of magnitude of the proportion. Mr. Stone, in his paper referred to above,² compares percentages calculated on

¹ See also Table 20, Part III.

² National Income : 1930-41 : net national income at factor cost, as given by R. Stone in the *Economic Journal*, June-Sept. 1942. As Mr. Stone's figures, are for calendar years, we have taken as the national income for each fiscal year the average of the figures for the two calendar years concerned ³ For 1910-25 and for 1942 the net national income is estimated with the help of Mr. Stone's figures and those given in Lutz, *Public Finance*. ⁴ See Table V.

a somewhat different basis with those given for the United Kingdom in the Budget White Paper.¹ His percentages for expenditures are : in the United States 20 per cent in 1938 and 1939, 21 per cent in 1940 and 26 per cent in 1941. In the United Kingdom, 19 per cent in 1938, 44 per cent in 1940 and 52 per cent in 1941. The following figures represent the proportion of the national income devoted to taxation : United States, 20 per cent in 1938 and 1939, 21 per cent in 1940 and 24 per cent in 1941 : United Kingdom, 25 per cent in 1938, 29 per cent in 1940 and 37 per cent in 1941. Estimates on another different basis appeared in the *Economist* of 24th January 1942 (p. 106). According to these, total Government revenues in the United States were 22·1 per cent of the national income in 1938-39, 21·6 per cent in 1940-41 and 24·1 per cent in 1941-42. The corresponding estimate based on the Budget figures for 1942-43 is about 33½ per cent. The figures given for total Government revenues in the United Kingdom are 27·8 per cent of the national income in 1938-39, 31·2 per cent in 1940-41 and 37·3 per cent in 1941-42. Total Government expenditures (and in brackets those on defence or war) expressed as a percentage of the national income are given as follows : United States—1938-39, 29·1 (1·8) ; 1940-41, 28·4 (7·6) ; 1941-42, 45·9 (27·4) ; 1942-43 (on the basis of the Budget estimate), 66·5 (51). United Kingdom—1938-1939, 30·9 (8·7) ; 1940-41, 58·8 (42·1) ; 1941-42, 67 (45·50). For the fiscal year 1st July 1943 to 30th June 1944, \$38 millions out of the total expenditure of the Federal Government (or about 36 per cent) are provided for by taxation. The total national income is estimated to reach \$150 millions in the same period. Great Britain's taxation to total expenditure is 52 per cent and Canada's 47 per cent.

The second point refers to the New Deal policy of promoting recovery by " pump-priming ", by public works and by planning industry in various directions. Clearly, the figures give no conclusive proof whether recovery, or the slow pace of recovery, was due to the New Deal or to the fact that it was not carried out rigorously. What they do indicate is that in spite of the huge increase, by peace-time standards, in Federal expenditures and deficits, neither reached a very large proportion of the national income of so great a country. The percentages of Government expenditure in the table are small compared with the tremendous fall in the national income. On the supposition that the New Deal was the correct policy for combating the depression, it could not have fully succeeded unless Government activities extended to a far greater sector of the national economy than was possible within the existing constitutional and economic framework. Pessimism among business men and the decline in private building construction more than counteracted the large expenditures by Govern-

¹ Cmd. 6347, sections B and E.

ments, and therefore unemployment remained at a high level.

We turn now to a feature in which the United States differs from the other Federations studied in this Enquiry — the relative importance of Local Government in public finance. Until the depression Local expenditures exceeded Federal ones — before the war of 1914–18 they were considerably larger than Federal and State expenditures combined. The contrast, even now, is larger than the tables suggest, because a substantial proportion of State expenditures — one-third in 1936–37 — consists of grants, mostly in aid of specified activities, to Local Governments. Nevertheless, as we have seen, H. C. Adams was mistaken when, in 1898, he expected Local expenditures to increase more rapidly than State and Federal expenditures.¹ As the modern community grows and becomes more complex, there is not only a steady tendency for Government functions to expand and to multiply, but also for the higher layers of Government to assume an even greater share of the responsibility. The case of relief during the great depression has already been mentioned. We shall return to this question when considering the details of public expenditure. Meanwhile, it is necessary to analyse briefly the tax structure of the United States.

Government Revenues

Revenues from taxation only have been given, because of the difficulty of obtaining comparable data of other revenues for all three layers of Government. Detailed statistics are very scarce, especially in the case of Local finance. Fairly complete data for a considerable proportion² of Local Government units are collected at ten-year intervals, but the last year for which they are available is 1932. Figures for cities of 100,000 or more inhabitants are available for other years. To the total tax collections of these cities in 1937–38, amounting to \$1940 millions has, therefore, been added a rough estimate³ of \$2800 millions representing all other Local Authorities. It has been assumed that the general property tax accounted for 95 per cent of all Local tax revenues, and not only of those of cities with a population of 100,000 or more. This is probably not very far from the truth.⁴ Local figures for “miscellaneous taxes” contain items which, if data were available, would be classified under other heads such as business or consumption taxes. The Local totals exclude grants and shared taxes.

¹ H. C. Adams, *Science of Finance*, New York, 1898, p. 45, quoted by Dr. Mabel Newcomer, *Taxation and Fiscal Policy*, New York, Columbia University Press, 1940.

² Totals (though not details) relating to the year 1931–32 are available for all Local Authorities.

³ Made by the Tax Institute, University of Pennsylvania.

⁴ Dr. Mabel Newcomer (*op. cit.* p. 28) gives the proportion of Local Government tax revenue derived from the property tax as 87 per cent in 1900 and 94 per cent in 1939.

State revenues from taxation given in Table VII represent total collections by the States, whether or not shared with Local Governments, plus the State share of locally collected taxes. Separate data for individual and corporate State income taxes are not available for all States, though in some cases they are available for a few years other than 1937-38. In the latter cases the figures have been utilised to estimate roughly the

¹ No detailed data for all Local Authorities are available except for 1931-32. Tax revenues of cities of 100,000 or more inhabitants amounted, in 1937-38, to \$1940 millions, of which \$1815 millions represented the property tax. Total tax revenues of other local governments were estimated at about \$2800 millions by the Tax Institute, University of Pennsylvania. It has been assumed that the proportion of total local tax revenues derived from the property tax was the same as in the case of cities of 100,000 or more inhabitants. (See also text.) The totals do not include shared taxes, grants, service charges for current services and other minor items. Details for cities of 100,000 or more inhabitants in 1936-37 are given in Table 9 in Part III.

² Group II includes taxation of property of various kinds, not only real estate, as it has not been possible to separate out the latter. This fact should be kept in mind when comparisons are made with other chapters of this Enquiry.

³ This excludes (a) taxes on gross receipts or turnover of businesses, which have been given under General Sales Taxes, and (b) the Unjust Enrichment Tax, shown separately.

⁴ A tax levied on net income arising from Federal excise taxes shifted to the vendee but not paid, Federal excise taxes shifted by the vendee for which he was reimbursed by the vendor, and refunds and credits of Federal excise taxes shifted to others.

⁵ Licences and fees for the privilege of conducting business, except (a) those based on net income (included under income taxes) and (b) those levied specifically on public utilities (included under utility taxes).

Note.—In order to get comparable figures for all Governments, the table has had to be limited to revenues from taxation. This should be borne in mind when comparisons are made with other chapters of this Enquiry. See also Table I.

For grants, etc., from the Federal Government to the States, from the States to the Local Authorities and from the latter to the States, see Table 10 in Part III.

⁶ Taxes levied on natural resources at the time of production, or severance from the earth.

⁷ Includes various taxes, among them admissions and licences of various amusement places.

Sources.—*Tax Yields, 1940* ; Statistical Abstract for the United States, 1940.

proportions of the State income tax collections representing individual and corporate taxation. In this way the known totals of income tax collections of States for which details are missing have been split up, and approximate total figures for individual and corporate income tax collections obtained.

The revenue system as a whole can hardly be said to be either very progressive or very regressive. There is a tendency for it to become more

progressive and it is among the more progressive of the revenue systems studied.

Tax revenues are fairly evenly divided among three divisions: (1) Groups I and III, *i.e.* Progressive Taxes (taxes on individual income and death duties, etc.) and taxes on business (mainly on corporate income and undistributed profits). These two groups together comprise a little over 29 per cent of total tax revenues. Out of this, personal and corporate income taxes together represent 21 per cent of the total. Personal income taxes represent 11 per cent, estate and gift taxes over 4 per cent, making a total for Group I (Progressive Taxes) of 16 per cent. Corporate income taxes represent 10 per cent, the Federal tax on undistributed profits 1 per cent, and other business taxes 3 per cent, making a total for Group III (Taxes on Business) of 14 per cent. (2) Group II, Taxes on Property. This division comprises 36 per cent of total tax revenues, of which 35 is general property taxation and consists almost entirely — to nearly 95 per cent — of local property taxes. Hence, even in 1937-38, the general property tax was still by far the most important tax in the United States so far as yield is concerned. It should be remembered that this is a *general* property tax which is levied not merely on real estate but on other property as well. It has not been possible to eliminate from Group II taxes levied on property other than real property. Care should therefore be taken in any comparisons between these figures and those in other chapters of this Enquiry. (3) Group IV, mainly Consumption Taxes. This division comprises 34 per cent of total tax revenues. Of all taxes placed under this head, only about 4 per cent go to Local Governments, the remainder being divided evenly between the Federal and State Governments. The most important part of the 34 per cent of total tax revenues represented by this group is the excise taxes on gasoline, etc. — 8 per cent, largely State taxes. Other excise and similar taxes are those on liquor, 6 per cent; tobacco, 5 per cent (both mainly Federal); motor vehicles, 4 per cent (mainly State); other excise taxes, 2 per cent: total excise taxes, 25 per cent. Then there are customs (a Federal tax), 3 per cent; general sales¹ and similar taxes, 4 per cent; and miscellaneous taxes, 2 per cent. Finally, social insurance contributions ("pay-roll taxes"), which have been excluded from the main part of Table VIII, comprised 10 per cent of all taxes *including* pay-roll taxes (a figure comparable in magnitude with those quoted above would be 11).

We have said that the revenue system as a whole is neither very progressive nor very regressive. But there are great differences in this respect between different Governments. The Federal revenue system is much more progressive than the others; in fact, it goes very far in that

¹ Group II includes taxation of property of various kinds, not only real estate, as it has not been possible to separate out the latter. This fact should be kept in mind when comparisons are made with other chapters of this Enquiry.

² These are percentages of the grand total including pay-roll taxes (\$6020 millions; \$3887 millions; \$4740 millions; \$14,647 millions).

direction compared with the other Federations studied in this Enquiry. Income and estate and gift taxes of all kinds accounted for 53 per cent of all Federal tax revenues ; individual income tax for 24 per cent, estate and gift taxes for 8 per cent (a total of 32 per cent for Group I — Progressive Taxes). Corporate income taxes accounted for 21 per cent, the excess profits tax¹ for 1 per cent, the tax on undistributed profits for 3 per cent and those on stock, transfer and document registry for 1 per cent (a total of 26 per cent for Group III — Taxes on Business). The only other taxes yielding a significant share of total Federal tax revenues were customs (7 per cent), and among excise and similar selective taxes those on liquor (11 per cent), tobacco (11 per cent), and gasoline and lubricating oils (4 per cent). All excise and selective taxes combined produced 30 per cent and general sales and similar taxes 2 per cent of Federal tax receipts, making (together with customs) a total of 39 per cent for Group IV — Mainly Consumption Taxes. In Group II — Taxes on Property — there was only the tax on capital stock (3 per cent).

Finally, there are the pay-roll taxes, or social insurance contributions.² These have only been making a significant contribution to revenues since 1936-37, and on a full scale only since 1937-38. In that year they produced 12 per cent of all Federal taxes *including* pay-roll taxes (a figure comparable in magnitude with those given above for other taxes would be 14). According to Dr. Mabel Newcomer,³ “the pay-roll tax is the youngest member of the tax family in this country, and promises to become the largest of all the State and Federal taxes. It may, in time, overtake the local property tax if the present movement for the relief of real estate continues.”

State pay-roll taxes⁴ on account of unemployment insurance, introduced together with the Federal ones, amounted to \$19 millions in 1935-1936, \$333 millions in 1936-37, \$746 millions in 1937-38, \$801 millions in 1938-39 and \$851 millions in 1939-40. In 1937-38 they accounted for 19 per cent of all State taxes *including* pay-roll taxes, and a figure comparable in magnitude with those given for other State taxes above (per cent of total State taxes *excluding* pay-roll taxes) would be 24.

Originally the Federal Government relied for its revenue mainly on customs, and the State and Local Governments on poll and property taxes. We have seen that with the expanding cost of Government and the general change in economic conditions the Federal Government has come to rely mainly on progressive taxes such as those on income, and to

¹ Cf. *Facing the Tax Problem*, The Twentieth Century Fund, New York, 1937, pp. 491-4.

² *Ibid.* pp. 494-500.

³ Mabel Newcomer, *op. cit.* pp. 25 and 26.

⁴ Including those in the District of Columbia.

some extent on excise taxation. A similar change has taken place in State revenues. The poll tax has dwindled into insignificance. The property tax is still the mainstay of Local Government finances, and partly for this reason the States have, with the general rise in expenditures, tended to relinquish it more and more, and to develop new sources of revenue. The general property tax now accounts only for 8 per cent of State tax revenues. Among the new State taxes those on income (of which about 7 per cent is on individual incomes) and estate and gift (5 per cent, making a total of 12 per cent for Group I) are indicative of the trend towards more progressive taxation. Other taxes on business (excluding public utilities) account for 6 per cent (a total of 13 per cent for Group III). But generally speaking, various sales and excise taxes, motor vehicle licences, etc., are far and away the most important part of the State revenue system. Group IV (Mainly Consumption Taxes) comprises no less than 67 per cent of the total. Of this, the most important items are taxes on gasoline and lubricants (25 per cent), motor vehicles (12 per cent), sales and use, gross receipts and gross income (15 per cent) and liquor (7 per cent). Actually, these figures hide the very great differences between individual States, which are illustrated by Table 14 in Part III. There is some degree of a general pattern, the principal feature of which is the reliance on consumption taxes, especially those on gasoline and motor vehicles, which marks the State revenue system as regressive. Nevertheless, the variations between States are very striking. At one end of the scale is New York, with far greater revenues (and expenditures and debt) than any other State, and, for a subordinate unit of Government, with a very progressive revenue system indeed. Various taxes on net income comprise 39·7 per cent of the total, of which 27·8 per cent of the total, or 70 per cent of income tax revenue, represents taxation of personal income. Estate taxation comprises 7·7 per cent; the property and poll taxes are entirely absent, and even gasoline represents only 15 per cent of total tax revenue. On the other hand, thirteen of the forty-eight States levy no income tax at all; Nevada has no estate or similar taxes. A few States like Nevada still rely heavily on property taxation; others, such as Georgia and Florida, derive about half their tax revenue from gasoline. Texas, Oklahoma and Louisiana receive a considerable proportion of theirs from severance taxes¹ which do not exist at all in twenty-eight States. Again, the relative yield of individual taxes sometimes changes rapidly; for instance, general sales and similar taxes were of no importance before the depression; even in 1932-33 they comprised only about 1 per cent of

¹ Taxes levied upon natural resources at the time of production, or severance from the earth. Examples are taxes on mineral resources, oil and gas, timber, and sea products.

total State tax collections. In the next year they suddenly shot up to 9.2 per cent; in 1937-38 they represented 14.4 per cent, and two years later 15.2 per cent, of all State tax receipts. Taxes on liquor, which comprised 11 per cent of Federal and 7 per cent of State tax revenues in 1937-38, were, of course, practically non-existent during the Prohibition era — one of the main reasons why Prohibition was abolished at the bottom of the depression.

Finally, there is Local taxation. This has been much more constant, as a whole, than either Federal or State taxation, both in amount and, especially, in composition. As of old, the property tax is by far the most important source of Local Government revenues, and hence, in view of the relative importance of Local Authority finance, has remained, at any rate until the present war, the largest single source of revenue in the United States.

It must, however, be remembered that nearly a third (32 per cent in 1936-37) of State expenditures consists of grants to Local Authorities,¹ and that a not inconsiderable proportion (over 8 per cent in 1936-37) of total State tax collections are actually shared taxes forming part of Local Government revenues. This reduces the preponderance of property taxation in Local Government finance. Another factor working in the same direction are the receipts from public utilities, as may be seen from Table 9 in Part III. (The effect shown there, relating as it does to the 94 largest cities only, is naturally greater than for Local Governments as a whole.)

The summary figures for Local Governments hide the great diversity between different types of Local Authority, of which there are at least half a dozen. Some more details, relating to 1931-32, have been given in Tables 6 to 9 in Part III. A summary of the total figures is given in Table IX overleaf.

The importance of the property tax for all types of Local Authorities is obvious. Only "cities, towns, villages and boroughs" derived a considerable revenue (\$487 millions) from public service enterprises. The importance of the school districts should be noted. It is really greater than is apparent from the above figures, as there is much overlapping between school districts and cities, towns, etc. A characteristic of Local Government in the United States is the enormous number of Local Authorities, many of them small or overlapping. In order to sum up the situation we can hardly do better than to quote Dr. Newcomer on this subject: ²

There are approximately 175,000 taxing jurisdictions in the United States. New York alone has 12,000. Many of these jurisdictions are too small to give efficient service. This is often true of the rural school district.

¹ See Table 10 in Part III.

² Mabel Newcomer, *op. cit.* pp. 10 and 11.

³ Less than \$500,000

⁴ Capital expenditure out of revenue.

Moreover, there has been a tendency to transfer functions from the smaller to the larger jurisdictions as improved means of communication have become available. This rarely results in the abolition of the smaller unit of government. Too many political offices are involved. Consequently, the useless shell of government remains long after its activities have been abandoned.

The New York town is a case in point. Its chief activity is the maintenance of minor rural roads. The county could do this more efficiently with economy of road machinery and a better co-ordinated system. However, a town has at least twenty officials. For New York State as a whole, this means approximately 20,000 political jobs. The emoluments of office are for the most part pathetically small, but they may represent the only cash income of the recipient. This is a power to be reckoned with.

In Illinois where counties with and without townships are to be found side by side, the per capita cost of government is appreciably lower in the counties without townships. About half the states in the country manage well enough without this subdivision. Some local government is desirable; but one, or at most two, layers of local government in addition to Federal and State governments are probably adequate. Certainly the five layers of government existing in some New York villages (county, town, village, school district and special district) are hard to justify.

To sum up, the Local Government system of taxation has changed very little during the past decades. It still relies mostly on the taxation of property, not always organised in the most economical manner. It is definitely regressive, a feature common to Local Government revenue systems.

On the other hand, the Federal and State systems of taxation have undergone revolutionary changes during the present century. In 1900 the Federal Government drew nearly all its revenues from customs and from excise taxes on liquor and tobacco. In 1937-38 these had declined to 28 per cent of Federal tax revenues and a little less than 25 per cent of total Federal revenues. Apart from the tax on gasoline, the new taxes which are now the main Federal revenue-producers are almost entirely taxes on individual and corporation income and estate and gift taxes. Thus, the Federal tax system has changed from a very regressive to a considerably progressive one.

The change in the State revenue system is also very marked, but is of a slightly different character. At the beginning of the century about half the total State revenues were derived from the property tax. By 1937-38 it had declined to 8 per cent of State tax revenues and about 6 per cent of total State revenues. Since then it has been declining still further. The new taxes which have taken its place are of two kinds. First, there are the taxes on income and succession, which have tended to make the State revenue system more progressive. But much more important than these are the various excise and similar taxes which fall mainly on consumption — gasoline, motor vehicles, liquor, general sales. In addition, there are the pay-roll taxes, comparatively new revenues for both the Federal Government and the States.

Now let us turn to the question of intergovernmental and other non-tax revenues. For the reasons already stated, it has not been possible to show the figures for these receipts in Tables VII and VIII, as has been done in the other chapters of Part I of this Enquiry.

According to the figures given in the Statistical Abstract of the United States, 1940, and summarised in Table 1 of Part III (see especially footnote 4), tax collections as given in Table VII of this chapter represented about 84.6 per cent of the total Ordinary Receipts of the National Government during 1937-38. Of the remaining 15.4 per cent, 12.1 represents social insurance contributions, 0.4 Panama Canal tolls, etc., 0.5 seigniorage, 1.1 interest and other receipts from securities, and 1.3 miscellaneous receipts. Hence nearly the whole of the revenues of the National Government are derived from taxation and social insurance contributions. This contrasts, for instance, with India, where the Central Government derives about 39 per cent of its ordinary revenue from public utilities (especially railways) and from miscellaneous sources such as interest, contributions from Indian States, and defence receipts.¹

Revenue figures for States in 1936-37 (the latest year for which fairly full details are available), as given in the Statistical Abstract of the

¹ See Chapter VII, Table VI, pp. 202 and 203.

United States, are summarised in Table 3 of Part III. According to this, 75.9 per cent of State revenues in 1936-37 were derived from taxation. Of the remaining 24.1 per cent, 14.3 were derived from grants (13.8 grants from the Federal Government and 0.5 from Local Authorities), 4.4 from charges for current services, 1.2 from contributions from public service enterprises, 0.1 from special assessments and special charges and 4.1 from all other sources. Thus, the proportion of revenue derived from taxation is appreciably lower than in the case of the Federal Government. A figure comparable with the 84.6 per cent given for Federal tax revenues would be even lower than 75.9 per cent. The definition of a tax used by the United States Department of Commerce, like that used in the Enquiry into the Burden of British Taxation,¹ is appreciably wider than that used by the Tax Institute, University of Pennsylvania, on whose compilations Tables VII and VIII are based.² The figure of total State tax collections given by the Institute for 1936-37 (\$2932.2 millions less \$260.0 millions of local shares of shared taxes, making a tax revenue of \$2672.2 millions) represents 65.3 per cent of total State revenues as given in Table 3 of Part III (\$4093.2 millions). This compares with 73 per cent in the case of the Indian Provincial Governments.

The latest detailed Local Government figures, as has already been mentioned, are those for 1932, since when the totals have declined as a result of the expansion of National and State Government functions consequent on the depression and the New Deal. In 1932 total Local revenue receipts, as shown in Table 6 of Part III, amounted to \$6644.0 millions. Of this, taxes comprised \$4715.9 millions, or 71.0 per cent.³ Since then the proportion may have risen. Thus, for all Governments together, the percentage of revenue derived from taxation in 1937-38 must have been in the neighbourhood of 78 per cent.

Table 10 of Part III, as well as Tables 3 (especially footnote 2), 4 and 5, illustrate the system of intergovernmental grants as it exists in the United States. Most of the figures are for 1936-37, the last year for which we have been able to obtain fairly detailed data. The system has several striking characteristics, of which the following three should be noted.

First, there is a much closer link between the revenues and expenditures

¹ *The Burden of British Taxation*, by G. Findlay Shirras and L. Rostas. National Institute of Economic and Social Research, Economic and Social Studies II, Cambridge University Press, 1942; New York, Macmillan & Co., 1943.

² *E.g.* the percentages in Table VIII exclude social insurance contributions, though they include under State tax collections (instead of under Local ones) the Local shares of State-collected shared taxes.

³ Of the remaining 29.0 per cent, grants from higher layers of Government amounted to 9.3 and earnings of public service enterprises to 7.8 per cent of total Local Government revenues. The smallness of the proportion due from public utilities is a point of contrast with that of other Federations studied in this Enquiry.

of State and Local Governments than there is between either and the National Government. This shows itself mainly in two ways: a considerable proportion of State and Local tax revenues consists of taxes shared between State and Local Governments, quite apart from grants; and nearly a third (32 per cent in 1936-37) of State expenditures consists of grants to Local Authorities, as mentioned above.

This last phenomenon is closely connected with the second point, namely, the fact that most grants, even those from the Federal to State Governments, are made for specified purposes. We find, therefore, not so much a system in which the higher layers of Government subsidise the lower, *e.g.* as a result of having more progressive and more expanding sources of revenue, but rather a system in which the higher layers of Government use the administrative machinery of the lower layers to translate the allocation of their financial resources into effective services. As can be seen from Tables 5 and 10 in Part III, State aid to Local Authorities is allocated almost exclusively to the secondary functions of Government, and here again, with the notable exception of highway maintenance, mostly to the social services. Of these, education is definitely the most important in this respect, with relief (usually classified as "charities") in the second place. In 1936-37, out of all State grants to Local Authorities (or "minor civil divisions"), 99.7 per cent represented secondary functions of Government, of which 77.5 per cent was spent on social services (education 57.4 per cent, relief 19.9 per cent and public health 0.2 per cent) and 19.0 per cent on developmental expenditure (of which 18.9 per cent went to highways).

Similar features characterise Federal grants to the States, and this leads to the third point, the way in which the States have become the agents carrying out the National Government's social security legislation. (The relevant parts of the tables are the footnote to and Section E of Table 10 in Part III.) In 1936-37, grants comprised, as we have already seen, 14.3 per cent of State revenues, 0.5 per cent being grants from minor civil divisions and 13.8 per cent grants from the Federal Government. Of the latter (\$564.8 millions), 56 per cent was for highways, 27 per cent for relief, 4 per cent for education, 2 per cent for public health, 2 per cent for unemployment compensation administration and 8 per cent for other purposes. But the place of the States in the system created by the New Deal is only appreciated when we remember that in 1939-40 (the last year for which it has been possible to obtain detailed figures) Federal grants to States and Territories¹ for public assistance and for administration of the unemployment compensation laws and State employment services amounted to \$345.0 millions. Of this total, \$61.6 millions represents

¹ The share of the Territories in these figures is very small.

unemployment compensation and \$283·4 millions public assistance (\$231·1 millions for old age-pensioners, \$46·1 millions for dependent children and \$6·2 millions for the blind). In Table X below and in Table 2 of Part III the expenditure of the National Government under the Social Security Act in 1937-38 is given as \$332 millions. Apart from administrative expenses, this figure represents entirely grants to States and refunds to States of taxes collected under the Act. Reference has already been made to the growing source of revenue which the States have found in the pay-roll taxes for unemployment insurance which they, together with the Federal Government, levy. It can thus be seen that as the higher layers of Government, and especially the National Government since the New Deal, have taken over more of the responsibility for the expanding social services, the financial and administrative division between the various Governments has become less clear-cut, and co-operation in specific fields has increased.

Government Expenditures

The discussion of the American system of intergovernmental grants for social services has led us from the field of revenue into that of expenditure. This is now to be discussed in more detail. A summary picture of the situation is conveyed by Tables X and XI.

Owing to the lack of complete and comparable data for all Governments, only National Government figures for 1937-38¹ and State and Local figures for the latest available years could be given. This means 1936-37 figures for States (taken from the Statistical Abstract of the United States, 1940)² and 1931-32 figures for Local Governments.³ In the latter case, the figures summarised in the Statistical Abstract and reproduced in Table 6 in Part III of this Enquiry are taken from *Financial Statistics of State and Local Governments, 1932* (United States Department of Commerce, Bureau of the Census).⁴ That volume contains details for all States and all types of Local Government so far as they are available. Unfortunately there are large gaps in the details, though the total expenditures on operation and maintenance of general departments, on operation and maintenance of public service enterprises, on interest and on outlays,⁵ and hence the grand totals, are complete. We have utilised such details as are given to estimate the distribution among the various heads of the total expenditure on operation and maintenance of general departments. As the figures refer to different years (one of them before the New Deal),

¹ Owing to the impossibility of giving comparable detailed data for 1937-38 for all Governments, National expenditures from revenue for that year have been given as in Table 2 in Part III, State cost payments of general government (i.e. excluding public service enterprises) for 1936-37 as in Table 4 in Part III, and Local cost payments (including public service enterprises) for 1932 — the last year for which details are available — as given in Table 16 in Part III. It should be noted that the State figures include a substantial proportion of grants to Local Authorities, the 1932 counterpart of which has not been eliminated from the Local figures; also that many of the Local items (as distinct from the grand total) have had to be estimated on the basis of figures available for some authorities in some of the States. For further details see the footnotes to the tables referred to.

- ² A few small items are included in "Legislation, administration and justice".
³ Given under "Charities, hospitals and corrections".
⁴ Not shown as a separate item in the official statistics.
⁵ Militia and armoured included under "Protection to person and property".
⁶ Includes hospitals and recreation.
⁷ Excludes hospitals which are included in the following item.
⁸ Mainly poor relief.
⁹ Charities only.
¹⁰ Mainly postal deficiency.
¹¹ Includes U.S. Housing Authority (\$165,000).
¹² Contribution from general Government funds only.
¹³ State and Local capital expenditure out of revenue.

it is, of course, impossible to give details for total Government expenditures (National, State and Local combined). Since 1931-32 Local expenditures have declined a little, both in absolute terms and relatively to National and State expenditures. In 1937-38 they must have amounted to about \$5900 or \$6000 millions. The figures include duplication due to inter-governmental grants. The most important of these are the State grants to Local Governments (32 per cent of total State expenditures), as we have already seen.

The true significance of the figures, especially of the percentages in Table XI, is grasped only when we compare them with the system existing before the New Deal. Tables 16 and 17 in Part III show public expenditures from revenue for all Governments in 1931-32, in millions of dollars (Table 16) and percentages (Table 17). There is a slight difference in arrangement between the two sets of tables. The State figures for "Charities,¹ hospitals and corrections" in Tables 16 and 17 contain all the items named. In Tables X and XI above "Correction" (State figures only) has been given as a separate item under Primary Functions, and State expenditure on hospitals included under "Public health". As it has not been possible to split up the 1932 figures in the same way, Local figures for "Charities, hospitals and corrections" in all four tables contain all these three items. The following other points should be borne in mind. First, State expenditure on public service enterprises in Tables X and XI above only represent contributions from general Government² funds, whereas the corresponding figures in Tables 16 and 17 as well as the Local figures throughout represent total expenditure from revenue on public service enterprises in 1931-32. Secondly, pensions are not given separately in the State and Local statistics. This means that the figure for "Pensions" in the totals columns of Tables 16 and 17 refer to National Government expenditure only, and that State and Local expenditures on primary functions as given in all four tables are somewhat below the true figures. Thirdly, the figures for Federal expenditures in Tables 16 and 17 include trust and related accounts totalling \$326.5 millions. This is the reason for the discrepancy between total Federal expenditures in 1931-32 as given in Table 16 and as given in Table 12. The latter total is the one which is comparable with that given in Table X for 1937-38.

The picture presented by the 1932 figures is one of fairly clear-cut division between the functions of the National Government and those of State and Local Governments. Apart from protection to person and property and debt services³ (neither a very large proportion of either

¹ Mainly poor relief.

² I.e. State finances other than those relating to public service enterprises.

³ And pensions.

State or Local expenditures), the subordinate political units were concerned almost wholly with the secondary functions of Government, such as social services and development.

The Federal Government, on the other hand, was mainly concerned with the primary functions — general administration, legislation and justice ; pensions ; debt services ; defence. Federal expenditure on the social services was very small indeed ; of the 33 per cent of Federal expenditures devoted to development 4 per cent represented the postal deficiency,¹ 16 per cent the Reconstruction Finance Corporation² and 12 per cent agriculture,³ *i.e.* even in 1931–32 the depression had caused an abnormal increase in the proportion of Federal expenditures devoted to secondary functions, thus foreshadowing the New Deal.

With the coming of the latter, the picture has changed completely, as can be seen by comparing Table XI above with Table 17 in Part III. In 1929 primary functions absorbed 87 per cent of Federal expenditures. In 1932, at the bottom of the depression and just before the New Deal, they absorbed 65 per cent ; and in 1938, 40 per cent. In the last-named year, the proportion of Federal expenditures devoted to the social services (40·7 per cent) exceeded that devoted to primary functions, or that devoted to the social services by either State or Local Governments in 1931–32. The relevant proportion of State expenditures was considerably higher in 1936–37 (48·2 per cent) than in 1931–32 (37 per cent). Nevertheless, Federal expenditures on the social services in 1937–38 were proportionately higher than the corresponding State expenditures in 1936–37, if grants to subordinate Governments be excluded from both totals. In the field of developmental expenditures, the National Government figures are proportionately the highest and the Local Government ones the lowest, whether or not grants are excluded. This is not very different from 1931–32. But it has to be borne in mind that Federal figures in that year were already affected considerably by the depression. In 1928–29 the proportion of Federal expenditures devoted to development was 10 per cent. If grants are eliminated it is safe to say that the pre-depression order was the reverse of that prevailing after the depression — *viz.* Local Governments devoted the highest proportion of their expenditures to development and the National Government the lowest. Nevertheless, the difference in this field in none of the years concerned was as striking as that in the field of social services.

It should also be borne in mind that the figures are profoundly affected

¹ A regular feature of U.S. finance, in striking contrast to other countries which derive a net revenue, sometimes substantial, from their Post Offices.

² A depression measure. The year in question was the first in which there was any expenditure under this head.

³ Swollen to 3·4 times the 1929 level as a result of the depression.

by the way in which National Government expenditure on "Recovery and Relief" is classified. Much of it would normally be regarded as developmental. Nevertheless, we have classified the whole of this expenditure as social services, because their object is not so much to develop the country as to combat depression and unemployment.

Before the depression the National Government was mainly concerned with the primary functions of government, and the State and Local Governments with the secondary functions. After the depression and the New Deal had had their effect, the National Government still devoted a much higher proportion of expenditures to primary functions than did the other Governments, but the difference was very much less marked, and another difference had appeared. The latter only becomes apparent when we analyse into their components the otherwise proportionately similar expenditures on the social services. The expenditure of the States and Local Authorities on social services is devoted to education (by far the most important head), public health (including hospitals and recreation) and poor relief. The latter is the least important of these heads in the case of Local Government expenditures, but the proportion of State expenditures devoted to it rose considerably between 1931-32 and 1936-1937.¹ The new Federal expenditure on social services is devoted almost entirely to social security measures — the recovery and relief programmes to combat depression and unemployment — and unemployment, health and pension insurance schemes. This brings home once more the essential characteristic of the depression and post-depression era in respect of Government functions. These functions expanded, and expanded mainly in the field of those social services which have not been described. As they expanded, a proportionately larger share of such expenditure was taken over by the higher layers of Government, and especially by the Federal Government.

The distribution of expenditures as presented in Tables X and XI above may be summarised briefly as follows.

National Government expenditure on primary functions in 1937-38 was 40·0 per cent of the total. Of this 12·8 per cent was on defence, 12·0 per cent on debt services (other than debt retirement), 8·6 per cent on pensions and 6·6 per cent on legislation, administration and justice (including a few small items on protection to person and property, education, etc.). Secondary functions absorbed 60·0 per cent of National Government expenditures. Of this 40·7 per cent was on social services —

¹ State expenditure on "Charities, hospitals and corrections" combined was 11·0 per cent of total State expenditures in 1931-32 and 24·9 per cent in 1936-37. Of the latter figure, 17·7 per cent of total State expenditures represents charities (poor relief), 5·3 per cent hospitals and 1·9 per cent corrections.

29.3 per cent recovery and relief, 4.4 per cent expenditure under the Social Security Act, 5.1 per cent old-age reserve account and 1.9 railroad retirement; 19.2 per cent was on development — 6.2 per cent agriculture (including Department of Agriculture), 4.3 per cent Civilian Conservation Corps, 2.2 per cent river and harbour work and flood control, 2.0 per cent public highways,¹ 1.8 per cent public works,² 0.8 per cent public buildings, 0.6 per cent Post Office,³ 0.6 per cent Tennessee Valley Authority, 0.5 per cent reclamation projects, and 0.2 per cent other heads. Miscellaneous expenditure (District of Columbia, United States share) absorbed 0.1 per cent of total Federal expenditures.⁴

In 1936-37⁵ primary functions absorbed 12.8 per cent of all State expenditures (18.7 per cent of direct expenditure and 0.3 per cent of grants).⁶ Of this, 4.4 per cent of the total (6.4 per cent of direct expenditure) represents general administration, legislation and justice, 3.4 per cent (5.2 per cent of direct expenditure) represents debt services, 3.1 per cent (4.3 per cent of direct expenditure and 0.3 per cent of grants) represents protection to person and property, and 1.9 per cent (2.8 per cent of direct expenditure) correction. Secondary functions absorbed 87.2 per cent of total, 81.3 per cent of direct and 99.7 per cent of grant expenditures. Of this, 48.2, 34.4 and 77.5 per cent respectively went to social services — education 24.0 (8.2, 57.4) per cent,⁷ public health 6.5 (9.5, 0.2) per cent, relief 17.7 (16.6, 19.9) per cent; 15.6 per cent of total State expenditure (13.9 per cent of direct expenditure and 19.0 per cent of grants) went to development — 13.2 (10.5, 18.9) per cent on highways, 2.3 (3.3, 0.1) per cent on development and conservation of natural resources, and 0.1 (0.1, 0.0) per cent on contributions to public service enterprises.⁸ Outlays⁹ absorbed 20.6 per cent of total and 30.2 per cent of direct expenditure, and miscellaneous items 2.8 per cent of total, 2.8 per cent of direct and 3.2 per cent of grant expenditures.

Grants represented 32 per cent of total expenditure, 1 per cent of that on primary functions (4 per cent of that on protection to person and

¹ \$152 millions. Additional expenditure, amounting to \$85 millions, is included under "Recovery and Relief", making a total Federal expenditure on highways of \$237 millions. A large proportion of this consists of grants to States.

² Mostly loans and grants to States, municipalities, etc.

³ Mostly postal deficiency.

⁴ The larger figures for 1931-32 in Tables 16 and 17 in Part III are due to the inclusion of trust and related accounts.

⁵ See also Table 5 in Part III.

⁶ Note, however, that pensions have not been given as a separate item under primary functions, but included under the various departments with which they are connected.

⁷ 77 per cent of State expenditure on education consists of grants to minor civil divisions such as school districts.

⁸ But see p. 55 above on the significance of this last figure.

⁹ See note 5 above.

property), and 37 per cent of that on secondary functions. 51 per cent of all expenditures on social services (education 77 per cent, public health 1 per cent, relief 36 per cent) took the form of grants. The figures for development are 39 per cent — 46 per cent for highways and 1 per cent for development and conservation of natural resources. No grants were made for outlays, and grants for general purposes represented 35 per cent of miscellaneous expenditure.

As in the case of revenues, these figures hide substantial differences between States, into which we cannot, unfortunately, enter into more detail here. An indication of the differences is given by Table 15 in Part III, which compares interest payments in 1936-37 with total expenditures of all States, individually and by regions.

Of Local Government expenditures in 1931-32, 25.7 per cent went to primary functions — debt services 10.4 per cent, protection to person and property 8.1 per cent, and legislation, administration and justice 7.2 per cent.¹ Secondary functions absorbed 74.3 per cent; 38.2 per cent represents social services — education 27.8 per cent, public health 5.0 per cent, and charities (relief),² hospitals and corrections 5.4 per cent; 13.0 per cent represents development — public highways³ 8.5 per cent, public service enterprises 4.3 per cent and development and conservation of natural resources 0.2 per cent; 20.9 per cent of total Local Government expenditures in 1931-32 represents outlays and 2.2 per cent miscellaneous items.

As in the case of revenues, there is considerable diversity between different types of Local Authorities. This is illustrated to some extent by Table IX on p. 48 above, and by Tables 6 and 8 in Part III. To take an example, the estimated expenditure of Local Authorities on education,⁴ as given in Table X above, was \$1965 millions in 1931-32. The (known) total expenditure of school districts⁵ under this head was \$1243.6 millions, or 63 per cent of all Local expenditure on education and 99.5 per cent of the total expenditure of school districts. Expenditure on public service enterprises, interest and outlays was proportionately higher for cities, towns, villages and boroughs than for other Local units. Especially is this true of expenditure on public service enterprises — 7.9 per cent as compared with 0.03 per cent in the case of counties, 0.9 per cent in that of

¹ But see p. 58, note 6 above on pensions. Moreover, expenditure on correction is included in "Charities, hospitals and corrections" given under Social Services.

² This item has probably declined in importance since 1931-32.

³ Duplication is unusually large in the case of figures for highways, as these figure are an important item among the grants both from the Federal Government to the States and from the latter to Local Authorities.

⁴ Schools and libraries.

⁵ Exclusive of schools under the administration of counties, cities, towns, villages and boroughs.

other Local Authorities and 4·3 per cent for all Local Governments together. County expenditure on highways (16·7 per cent of total county expenditures) was nearly twice as high proportionately as that of all Local Authorities taken together (estimated at 8·5 per cent). For as we have seen, there is a multiplicity of Local Governments and a division of function between them in the United States which contrasts with the consolidation that has characterised the British system since the Local Government Acts of 1888 and 1889. Details of revenues and expenditures of cities of 100,000 or more inhabitants in 1936-37 are given in Table 9 of Part III.

Tables 11 and 12 in Part III give total revenues and expenditures of all Governments, by regions, for 1931-32 and 1936-37, as well as the percentage increases between the two years in question. Local figures for the second year are not available, and only rough estimates of the grand totals have been given. The figures show throughout a proportionately greater increase in revenues than in expenditures,¹ largely owing to the abnormal deficit position in the depression year 1931-32. In the case of State and Local Governments this applies also to the figures given in Table V above (cf. the second percentage column). In the case of the National Government it seems at first sight to be the other way round. The puzzle is solved if we remember that in Table V 1937-38 is compared with 1929-30, and in Tables 11 and 12 in Part III 1936-37 is compared with 1931-32 — a year in which the Federal Government already had a considerable deficit (\$2·5 billions). The increase in revenues was most marked in the case of the National Government and, among States, in that of the North-eastern and Middle States and of California (in ascending order). This means that the predominance of the National Government and of the regions concerned has been further increased. The matter is less simple in the case of expenditures. The National Government leads again, and California among State regions, with the Middle States second. But the increase in the North-eastern States is the second lowest, the order being California, Middle, Pacific North-west, South-west, Mountain and Great Plains, North-east and South-east. There was a decline in Local Government expenditures.

IV. THE PUBLIC DEBT

The composition of and the changes in the public debt of the United States in recent years are shown in Tables XII and XIII below and in Tables 13 and 21 in Part III.

¹ Local expenditures actually decreased, while the change, probably an increase, in revenues was slight.

TABLE XII

Source.—Statistical Abstract of the United States, 1940

The debt of the National Government reflects very closely in its changes the political and economic events of recent decades. The gross debt amounted to \$1225 millions on 30th June 1916. Three years later the war had swollen it to \$25,842 millions. Then began a period of steady reduction, the lowest level being reached in 1930 with a gross debt, on 30th June, of \$16,185 millions. Then came the depression and the New Deal, and with them a new era of deficit-financing. By 1932 the gross debt had risen to \$19,487 millions. The New Deal came, and by 1934 the debt amounted to \$27,053 millions. Four years later, by 1938, another \$10 millions had been added, making a total of \$37,167 millions. Since then it has risen steadily as a result of rearmament and war. The

¹ General Government only, i.e. excluding public service enterprises.

² Not available.

³ After deducting gold reserve against U.S. notes.

⁴ Made up as follows: Municipal debt, \$8934.8 millions; all other local debt, \$5889.2 millions; total, \$14,824.0 millions.

⁵ The figures cover the Government or the city corporation proper and independent school districts, sanitary districts and other independent districts practically co-extensive with cities; they also include a percentage of the financial statistics of the county Governments in which there are cities having over 300,000 population.

⁶ Net debt is funded or fixed debt less assets in general sinking funds. Note the difference in definition as compared with "A" above.

figures are: 1940, \$42,971 millions; 1941, \$48,979 millions; 1943 (Budget estimate), \$110,421 millions.

Side by side with the increase in the amount of debt there have been

changes in its composition. In 1932 three-quarters of it consisted of funded debt, or bonds. The following years, the first of the New Deal, saw an enormous increase in the floating debt, especially of notes (which increased from \$1260 millions on 30th June 1932 to \$11,381 millions on 30th June 1936). The first "pump-priming" deficits were financed very largely from this source. By 1935 the floating debt represented half the total gross debt. Then the tide began to turn. The floating debt was reduced (notes alone fell to \$6203 millions on 31st December 1939), and bonds rose from \$14,936 millions on 30th June 1935 to \$23,602 millions in 1938 and \$29,920 millions in 1940. All the above figures for bonds and notes exclude special issues to Government agencies and trust funds. The special issues were fairly stable and not large in amount until 31st December 1936, when they amounted to \$632 millions. But after that date they increased quickly — to \$1558 millions on 30th June 1937, \$2676 millions in 1938 and \$4775 millions in 1940. On 30th June 1938 they consisted of \$500·2 millions of bonds and \$2175·5 millions of notes. The increase in this item thus offset to some extent the decline in the market issues of notes and Treasury bills. Nevertheless, it remains true to say that whereas in the early years of the New Deal the increase in the public debt was largely an increase in the floating debt, in the later years it was mainly an increase in the funded debt.

We have seen how, in the past decade, Federal revenues and expenditures gradually overtook State and Local ones. This is true even more of public debt. During the decade preceding the depression, while the Federal debt was being reduced, State and Local debts both approximately doubled. In 1922 Federal net debt was nearly three-quarters of total governmental net debt. In 1932, when Federal debt, after reaching its lowest point in 1930, was already on the increase, the proportion had fallen to about one-half. In 1937, as Table XIII shows, it was again 66·2 per cent. State debt had risen comparatively little in the five-year interval, and Local debt had fallen more. Since then the preponderance of Federal debt has been increasing steadily, and the war promises to make it eclipse State and Local debt altogether.

Since the increase in the debt of the United States has been very largely due to deficit-financing caused by war, depression and "pump-priming", most of it is "dead-weight" debt. This contrasts with other Federations studied in this Enquiry such as South Africa and, especially, India. In these countries a much greater proportion of the public debt, especially of that of the Central Governments, is directly productive in the sense of producing its own interest. Of course, it may be said that the productivity of the debt incurred by the Roosevelt administration before the war is to be sought in the recovery it was intended to promote rather

than in interest received by the Government from investments. Nevertheless there can be no doubt that this debt will continue to be a much heavier charge on the taxpayer for decades to come than, say, is the case in India or in South Africa. The contrast is less in the case of Local Government debt. But even in the case of cities of 100,000 or more inhabitants debt of public service enterprises constituted, in 1937, only 34·3 per cent of the gross debt and 39·0 per cent of the net debt.¹

Summary figures for debt, like those for revenues and expenditures, hide the great differences between different units of Government. There are differences both in indebtedness and in credit standing. In this connexion it will be remembered that some of the States, such as Mississippi, Florida and Alabama, have repudiated or defaulted on their debts in the past. Table 15 in Part III compares interest charges and total expenditures of State Governments in 1936-37, individually and by regions. Two features are especially striking. First, the regions whose debt charges are proportionately above the average are the South-east (very marked), the North-east and (to a lesser extent) California. Secondly, the differences between individual States, even within the same region, are far greater than those between regions. The average expenditure devoted to debt charges for all States and regions is 3·5 per cent of total expenditures. The lowest for any region is 0·9 per cent (South-west), and the highest 6·1 per cent (South-east). The lowest for any State is 0·0 per cent (Florida) and the highest 18·8 per cent (Arkansas), both in the same region (South-east). Even New York (5·4 per cent) and New Jersey (7·1 per cent), though above the average, are far below Arkansas (18·8 per cent), South Dakota (10·6 per cent) and Tennessee (10·2 per cent), while Pennsylvania (2·0 per cent) is definitely below the average.

Indirect Debt

In addition to the direct public debt of the Federal Government, the last decade has seen a new development, the guaranteed security. Many of the Federal corporations created since 1932 have been financed by the issue of their own securities, guaranteed by the Government and constituting contingent liabilities of the United States. The process began with the creation of the Reconstruction Finance Corporation in 1932. As a result of the New Deal it grew enormously between 1934 and 1941 (see Table XIV). On 30th June of the latter year, the outstanding

¹ Net debt is here defined as funded or fixed debt less sinking fund assets. In the figures quoted above it means total gross debt less net balance held by the Treasurer of the U.S.A. in the case of Federal debt, and gross debt less sinking fund assets in the cases of State and Local debts.

guaranteed liabilities of the United States totalled \$6362 millions. But in October of the same year the Treasury announced that no more guaranteed securities would be issued, that those then outstanding would be converted into direct obligations of the United States, and that the Federal corporations would in future be financed directly by the Treasury. This chapter in the history of the United States debt may therefore be considered closed.¹

V. CONCLUSION

It is difficult to sum up briefly the main results of this study of American finance. The first outstanding feature is the great increase in public expenditures which was marked even before the war. Higher standards for old services and large-scale expenditures on new activities are noticeable in all layers of Government, but especially in the Federal layer in recent years. Secondly, the great depression of 1929-33 was accompanied by large expenditure on relief which has made the New Deal a landmark in American public finance. Deficit budgeting became the order of the day. Recovery, as bitter experience has taught, depends on increasing purchasing power, and the merit of deficit budgeting as a remedy for depression depended on whether Government borrowing increases purchasing power and whether this increase leads to greater spending. These

¹ Cf. H. Walter Hargreaves, "The Guaranteed Security in Federal Finance", *Journal of Political Economy*, Aug. 1942.

two features of American public finance have resulted in a change in tax structures. There is considerable competition for revenues among competing authorities, mainly between Federal and State and between State and Local Authorities. The multiplicity of taxing authorities is noteworthy. They number about 175,000 and some authorities are very small, leading to the levying of unequal taxes and also to high costs of collection. The number of taxes is also large. What constitutes a separate tax depends on difference in base and rate. It would not be wrong to state that the Federal tax system runs to over 100 taxes, and in New York State there are also 38 State taxes and seven Local taxes, or a total of 145 in all.¹ Ten of these taxes produce over nine-tenths of the total revenue. The three main taxes are the property tax, the personal and corporation income taxes, and the comparatively recent pay-roll tax. In the last century the three taxes which dominated all others were customs duties, a federal source of revenue, the property tax and the poll tax a so-called democratic tax which, like a club subscription, was the same for everyone contributing to the support of Government. Customs duties were a Federal source of revenue whereas property taxes were for State and Local purposes. The Federal Government under the Constitution could levy a property tax only in proportion to the population of the various States, since it has always been regarded as a direct tax. It was levied only on rare occasions by the Federal Government, and then, too, only with indifferent success. In the present century the property tax has become in the main a local tax. In 1900 more than half of the State revenues came from the property tax, but to-day only one-twentieth does. In place of this, in order of time, the following taxes have taken their place in State taxation: the motor vehicle licence tax, the stock transfer tax, the personal income tax (a quarter of the States of the Union levy no personal income tax), the gasoline tax, the general sales tax, the pay-roll tax and the excess profits tax. Local Authorities are dependent on property taxation and their powers are delegated to them by the States. They are handicapped in three ways; by imposition of tax limits and the extension of tax exemptions on the part of the States, and by the fact that, being small authorities, they are limited from taxing income or corporations. This third is perhaps the greatest of the restrictions.² On the whole, however, the limitations of Local Authorities in the field of taxation are economic, due to the restricted area of the authority and the impossibility of taxing, for example, corporations doing business elsewhere in the State. Local tax powers are delegated powers, and in recent years State Governments have been turning over to Local Governments—the

¹ Cf. Mabel Newcomer, *Taxation and Fiscal Policy*, Columbia University Press, New York, 1940, p. 17.

² *Op. cit.*, p. 48.

property tax as an exclusively local tax. State taxes are normally added to Local taxes and collected by Local officials. With the improvement in communication the number of businesses doing interstate business is increasing, and this makes the jurisdiction of State Governments in taxation more difficult, the advantage in tax administration being with the wide jurisdiction. Overlapping taxes are numerous, *e.g.* income taxes, corporation taxes and the taxation of liquor, tobacco and gasoline, and the cost of collection of separate levies is greater than for a single levy. Sometimes one layer of Government takes little or no account of the taxation imposed by another layer, so that the double burden becomes especially heavy. It is here that systematic integration of taxes is desirable, and, as shown in Part II, conflicts arise and the obstacles to be overcome are not at all simple. The Federal Government depends mainly on the taxation of personal incomes and corporations, pay-roll taxes, customs and the taxation of drink and tobacco. Thus, in 1940 Federal taxes amounted to \$5698 millions, of which *net* income taxes were personal income taxes \$982 millions and corporation taxes \$112 millions, pay-roll taxes \$838 millions, tobacco \$609 millions, alcohol \$624 millions, customs \$350 millions and estate duties \$331 millions. Pay-roll taxes were introduced by the 1935 Social Security Act and are earmarked for old-age benefits and unemployment compensation. The Federal old-age benefit is 2 per cent of the pay-roll (1 per cent from the employer and 1 per cent from the wage-earner). The unemployment benefit tax is a combined Federal and State levy of 3 per cent on the pay-roll. In some States it is higher. The productivity of the tax is very great, but the increase in old-age benefits without increasing the rate of contribution has been such that the reserve will not increase to the extent hitherto regarded as certain.

It is of interest to compare the changes in tax collections in recent years, expressed as percentages of the whole, exclusive of pay-roll taxes.

		Tax Collections (exclusive of Pay-roll Taxes)			
		1929	1933	1937	1940
Federal	37	23	39	38
State	17	21	23	25
Cities :					
(a) 100,000 and over	Local Governments	18 3 46 25	21	16	15
(b) 30,000-100,000			35	22	22
(c) Other Local Governments		
		100	100	100	100

If State and Local taxes as well as Federal taxes are included, taxation is now (1943) of the order of one-third of the national income excluding social security charges, as compared with 12 per cent at the end of the war of 1914-18 and 20 per cent in the late 1930s.

Another characteristic of American finance is its resiliency to the exceptional conditions of war. A few statistics in this connexion bring this out clearly. In 1940-41 total Federal expenditure was \$12·7 billions, of which \$6·3 was on national defence ; in 1941-42 this increased to \$30·6 and \$24 billions respectively ; in 1942-43 to \$82 and \$77 billions respectively, a remarkable increase especially since Pearl Harbour, 7th December 1941. In the year ending 30th June 1944 the Budget for war alone is anticipated to exceed \$100 billions (£25,000 millions), which, according to the President, is a maximum programme for waging war. In the last war, even in the peak year 1918-19, war costs were only one-sixth of the national income, but in 1941-42 they were not far short of one-half and in 1942-43 about two-thirds, and in the current year it is of the order of three-fourths. Such prodigious expenditures meant a great leap-up in production. The index of production of the Federal Reserve Board was 77 per cent above the level of September 1939, and the index of munitions production published by the War Production Board was 382 in October 1942 (November 1941 = 100). Durable goods production was up, as compared with September 1939, 150 per cent. Agricultural production reached in 1942 a new high level, \$15·6 billions, or one billion dollars above that of the previous record year, 1919. In the field of taxation there have also been surprises. In 1940-41 Federal taxation was \$8·3 billions, or excluding the pay-roll tax \$7·6 billions ; in 1941-42 \$12·8 billions, and excluding the pay-roll tax \$11·9 billions ; in 1942-43 \$17·8 and \$16·5 billions respectively ; and in the current year (1943-44) taxation will be seven times the level of 1939-40 taxation, the taxation revenue being estimated at \$35 billions. New taxation was \$7 billions in 1942-43 and \$16 billions in 1943-44. But this is not the whole story. Although these large sums are being raised by taxation, there are large war expenditures financed by loans. The gross debt on 30th June was, in billions of dollars, as follows : 1919, 25 ; 1930, 16 (the lowest since the 1914-18 war) ; 1935, 29 ; 1936, 34 ; 1937, 36 ; 1938, 37 ; 1939, 40 ; 1940, 43 ; 1941, 49 ; and 1942, 71. In his message to Congress on 11th January 1943 the President stated that the Public Debt will total \$135 billions in the year ended 30th June 1943, and by June 1944, \$210 billions under existing revenue legislation. These are astronomical figures and reflect national effort of a magnitude without precedent in world history. Nevertheless, in spite of the concentration of the war, " there will be ", as the President stated, " sufficient volume in our bill of fare, but less variety. That may hurt our taste but

not our health." Although borrowing has great psychological advantages over taxation because it seems to postpone the final reckoning of sacrifices, raises funds more quickly than taxes and makes available to Government large amounts of funds borrowed directly from the banks, yet, to avoid the inflationary and other abuses of borrowing, taxation has to be kept at the highest possible level. In this respect there has been a great advance in the financing of the present war as compared with that of the last world war. The taxes to loans ratio in 1942-43 was less than one-third as compared with one-half in Great Britain and over one-half in Canada. In the last war the United States and Great Britain met only 25 per cent of total central expenditures by taxation, France 13 per cent and Germany 10 per cent. One great difference, however, between the war burden on the United States and on Great Britain is that the United States has been able to expand output greatly without curtailing consumption below the pre-war level and without cutting the pre-war additions to capital by more than one-half. In Great Britain it was not possible to extend output in anything like to the same degree for several reasons, such as the smaller volume of unemployment, the higher proportion of man-power in the fighting services, the blockade and the air-raids. Consequently in Great Britain consumption had to be curtailed to a greater degree, and in place of a cut in the pre-war rate of investment a heavy inroad on accumulated capital had to take place. In this respect the United States has indeed been fortunate in being able to expand her war effort with so little effect on her future store of capital or on her present standard of living.

CHAPTER IV

THE PUBLIC FINANCE AND NATIONAL ECONOMY OF CANADA¹

I. CANADA'S NORMAL NATIONAL ECONOMY

To understand Canada's financial problems we have to look to the salient features of the Canadian national economy during the three-quarters of a century that have elapsed between the passing of the British North America Act, 1867, and the present war. The most striking fact is that the Canadian national economy before the war was a highly vulnerable one. Canada, the oldest Federation of the British Commonwealth, is linked up in economic solidarity with the outside world, especially with Great Britain and the United States. In international trade she plays an extremely important part. With a population of only over 11 millions she was sixth among the countries of chief importance in foreign trade; first in the tourist trade; fourth in the volume of shipping leaving a country's ports; and fourth in railway mileage. In 1929 her national income per head was greater than that of any other country except the United States, while in 1937 owing to drought Canada was sixth or seventh. She exported wheat and other agricultural products, many forest products and minerals such as gold, silver, copper, nickel, lead and zinc. Indeed her surplus was very great. She produced five times more wheat than she consumed, ten times more newsprint and twenty times more non-ferrous metals. Her surplus of wheat was 40 per cent of the world's exports of wheat, and her surplus of non-ferrous metals is also 40 per cent of the world's exports. Her export of newsprint was two-thirds of the world's exports. Canada, therefore, was a marginal source of supply for many commodities, her own production being great and her consumption small. The result was that any reduction in the world demand profoundly affected the prices which she got and also her ability to pay interest on the large amount of capital invested. This is all to the good on a rising market because she controlled the marginal supply, but on a falling market it was quite the reverse. Her imports included such essential raw materials as coal, oil, rubber, tin, manufactured iron and steel, chemicals and

¹ I am indebted to the Report of the Royal Commission on Dominion-Provincial Relations — the Rowell-Sirois Report (Ottawa Government Printer, 1940) — and to the Dominion Statistician who has supplied the latest available data. With the exception of Table II on p. 77, the tables in this chapter are based mainly on the data of Canadian public finance made by the Royal Commission and do not correspond with the Public Accounts of the Dominion and the Provinces.

textiles. Indeed Canada was one of the largest importers of coal, oil and steel products just as she was one of the largest exporters of wheat, newsprint and non-ferrous metals. Just before the present war Canada's trade with the United Kingdom was 30 per cent of her total trade, whereas the United Kingdom's trade with Canada was only 5 per cent of her total trade. Canada's trade with the United States was 50 per cent of Canada's total trade, while the United States' trade with Canada was only 15 per cent of the total United States' trade. It will be seen, therefore, that Canada's position in her financial relations with the outside world in ordinary times was vulnerable; she was not and could not always be in a strong position when it came to bargaining. Fluctuations in gross income and in net income were large at both extremes of the trade cycle. The financial relations of the Dominion, Provinces and Local Authorities were also subject to variations. Moreover, the Canadian national economy is made up of a number of very different areas, such as the Maritimes, Quebec, Ontario, the Prairies and British Columbia, and in many instances economic interests do not coincide with regional boundaries. There are sections of Quebec which are more closely allied to the Saskatchewan than to the neighbouring regional economies. In the Prairie Province of Manitoba there are areas evolving an economy of the Ontario type. In short, the Canadian national economy in ordinary times is made up of a number of very different areas, and the income of those areas varies enormously from year to year and from area to area. This is of particular importance in public finance. Take, for example, that important sector of Canadian economy, the wheat industry. Here we have large areas dependent on the profitable production of a single product; and where distress is due, as in the great depression, to a catastrophic fall in the price of wheat and to inflated costs and similar factors, such as a series of crop failures, then large-scale intervention is necessary to prevent a complete collapse of the industry. In such cases the cost was beyond the taxable capacity of Provincial and Municipal Governments. The Dominion, therefore, apart from the Provincial Governments had to assist with emergency grants.

A large part of the surplus of the national economy is concentrated in a few specially favoured areas. Provincial Governments with their important functions conferred by the British North America Act have large powers such as the control of the public domain, responsibility for roads and other public works, the major social services and direct taxation. In recent years there have been profound changes in social policy which are likely to be permanent. When it is remembered that the total income of the Prairies fell almost by one-half and income from agriculture by almost four-fifths taking the average of the years 1930 to 1937 as compared with the average of the years 1926 to 1929, it will be seen how important the

problem of the employable unemployed became. During the great depression of 1929-32 there were parts of the Prairie Provinces that threatened to become depressed areas. Widespread drought, recurring from time to time, also made widespread relief necessary both for families and for stock. The disparities in the impact of the depression ranged in a loss of income varying from 72 per cent in Saskatchewan to 36 per cent in Nova Scotia. The Prairie Provinces suffered most as they were dependent almost entirely on the export of wheat. The catastrophic changes brought about by the depression of 1929-36 have put enormous strains on the economy, on the constitutional division of powers and the economic policies of the Dominion Government. The manner in which the fall of income was distributed over the various Provinces was of much significance in the Federation.

Two other factors must be mentioned. The Dominion Government, which invested \$3000 millions in railways together with an investment of considerably over \$1000 millions in a privately owned railway, on the assumption that railways would have a monopoly of land transportation, had now to face serious competition from rival railways in some areas and from the newer method of road transportation falling exclusively or nearly exclusively within the jurisdiction of the Provinces. This made for rigidity in debt structures which becomes very serious in times of strain, as interest has to be paid. There is not only competition between the two railway systems themselves but also competition between railways and roads. The Provinces are developing means of transportation which may ultimately destroy the solvency of the railways, and there is the likelihood of over-investment in roads as in the past there was over-investment in railways, with the result that there may be even a still heavier burden upon the Canadian economy. There is also the question of tariffs which brought a relative increase in costs and worsened the conditions under which the exporting industries were operating at a time when the prices for wheat and other primary products were drastically falling. The result was that the standard was reduced and the defaulting of debt became more general.

To sum up : Canada's pre-war economy, depending as it did on a few specialised exports, was vulnerable. The large changes in income and the rigidities of the cost structure as a whole were obvious. The increased costs were brought about for national and political reasons, and further increased the vulnerability of the economy. There have been widespread disparities between the various regions which have been more or less constant ; in times of depression, however, these have been greatly intensified as between certain regions. This made it impossible for some Provincial Governments to weather the storm, and so gave rise to problems of Provincial and Local finance. On the one hand there have been elements

making for national integration ; on the other hand elements making for disintegration. The implications of the economic and social changes which have occurred in Canada in recent years have been of far-reaching importance in public finance. The Dominion Government has found it necessary to accept responsibilities of a character not foreseen at the time of Confederation. Several Provincial Governments have found themselves with resources insufficient to discharge their constitutional responsibilities, including the payment of fixed charges on their outstanding debt and including the cost of unemployment and other social services. Local Authorities have been confronted with the same problems and they have been compelled to make heavy levies on real estate and to impose other taxes which have not always been realised. The relations between Provinces and Local Authorities are an essential problem of Provincial finance. New constitutional responsibilities have to be undertaken, new revenue sources tapped or governmental burdens reduced, increased or adjusted to meet changes in circumstances.

II. THE BRITISH NORTH AMERICA ACT

Before we proceed to analyse the distribution of the revenues under the Canadian system it is necessary very briefly to refer to the British North America Act, 1867, sections 91 and 92. The Statute of Westminster, 1931, section 7 (1), it will be remembered, does not "apply to the repeal, amendment or alteration of the British North America Acts, 1867 to 1930, or any order, rule or regulation made thereunder". A minute examination of the British North America Act so far as it related to Federal finance is beyond the scope of this Enquiry : it would involve an excursion into Dominion constitutional law and numerous Privy Council decisions. Under section 91 the Dominion has power "to make laws for the peace, order and good government of Canada, in relation to all matters not coming within the classes of subjects by this Act assigned exclusively to the legislatures of the Provinces". By this clause the residue of powers not expressly given to the Provinces is reserved to the Dominion. The Dominion is also given unlimited powers of taxation (the raising of money by any mode or system of taxation). Section 92 (2) gives the Provinces power to levy "direct taxation within the Province". Section 92 (9) is not clear, as it is not certain whether indirect as well as direct taxation is authorised by the words "shop, saloon, tavern, auctioneer and other licences,". Can, too, licences be made to cover any kind of business activity or does it apply to a limited genus of which those specifically mentioned are examples ? This is not really important, because the chief source of Provincial revenues is direct taxation under

section 92 (2). The Privy Council has put a restrictive interpretation on section 91, viz. that the Dominion has power to make laws "for the peace, order and good government of Canada" only in temporary and overwhelming emergencies such as war, pestilence or famine. A deep-rooted social malaise, such as unemployment, is beyond the power of the Dominion unless it is comprised in the enumerated heads of section 91. This means that most of present-day legislation on the social services (which was never contemplated or expressly provided for by the North America Act, 1867) must be enacted by the Provinces. "There is much truth", says the Royal Commission on Dominion-Provincial Relations,¹ "as well as some exaggeration, in the contention that the 'Property and Civil Rights in the Provinces' clause² has become the real residuary clause of the Constitution." The Privy Council's decisions of 1937 on a number of Dominion measures, known as the Bennett "New Deal", again emphasised the wide range of Provincial powers in social security legislation. It was held that the Acts of the Canadian Parliament dealing with the weekly day of rest in industrial undertakings, with minimum wages and with the limitation of hours of work went beyond the Dominion Parliament's powers as they affected "Property and Civil Rights in the Provinces" under section 92 (13). For the same reason the Employment and Social Insurance Act providing for a national system of unemployment insurance in specified industries and financed by compulsory contributions from employers and employees and by contributions from the Federal Government was also held to be unconstitutional. Uniformity of standards in many kinds of social security and labour legislation is desirable, but the Dominion Government must leave this to the Provinces, and the Provinces were limited by the financial provisions in section 92 of the British North America Act. For a quarter of a century the Dominion had overcome the difficulty by giving conditional grants to the Provinces, but administrative co-operation had not resulted in efficient co-operation. The Privy Council also declared the Natural Products Marketing Act invalid. This Act provided for the marketing and distribution of products by a Dominion Marketing Board. The Privy Council held that the Federal power to regulate trade and commerce under section 91 (2) did not extend to the regulation of trading transactions completed within a single Province. The Dominion's power was confined to interprovincial and international aspects of trade. The decision of the Privy Council brought home again the fact that the power to regulate the economic life of Canada is divided between the Dominion and the Provinces, and neither the Dominion nor the Provinces can encroach upon the sphere of the other. At the same time the Dominion has extensive powers of economic regulation enumerated under section 91. It can

¹ Book I, *The Constitution Today*, chap. ix, p. 247.

² Section 92 (13).

control companies with Dominion charters ; the grain trade by declaring local works to be for the general advantage of Canada under section 92 (10c) ; banks, monetary matters, transportation, shipping, etc. (under the enumerated heads of section 91) ; and it can prohibit economic or industrial practices, *e.g.* certain kinds of trade combination, under the criminal law as a pretence or pretext to encroach upon Provincial powers. As the Constitution is now, it is doubtful whether or not delegation of legislative power is constitutionally possible. The delegation of power by a Province to the Dominion and vice versa would be a device for overcoming in practice the difficulties arising in regard to economic activities from the division of legislative power between the Dominion and Provinces of the Federation. It has recently been declared by the Supreme Court of Canada that Parliament or a Provincial legislature may authorise "delegation in depth" to the limits of their respective powers so long as Parliament or the legislature retains (as it must, premising its continued existence) the ability to withdraw the delegated authority.¹ Close and continuous co-operation is taking place and is in contrast with the original conception of federalism in which there was a clear-cut division of powers. It is doubtful, as already noted, whether such co-operation is sound from the viewpoint either of administration or of public finance. The history of the administration of conditional grants reinforces this. The constant danger of Dominion-Provincial friction affects spheres of joint administration. The Royal Commission on Dominion-Provincial Relations was of opinion that "Where legislative power over a particular subject matter is divided, it is ordinarily desirable that these powers should be pooled under the control of a single government in order to secure unified effort in administration."²

III. GOVERNMENT REVENUES BEFORE THE WAR

The summary tables below are intended to bring out the essential features of the revenue system, the public expenditures and public debt of Canada in the pre-rearmament year 1937. Data for war years have also been compiled, as has been done for the crisis years during the depression 1929-36 in order to study crisis finance in its various aspects. Further details are given in the general tables in Part III of the Enquiry.

The most arresting fact underlying all these tables is the greatly increased cost of government in Canada in recent years. Governments, Dominion, Provincial, and Municipal or Local, have been extending their services in all directions. This is clearly seen in the very rapid growth

¹ *Vide* Supreme Court of Canada in "Reference *re* Regulations (Chemicals) under War Measures Act" (*Canadian Bar Review*, Toronto, Feb. 1943).

² Report, Book I, p. 259.

in expenditures connected with social security and with development. With the growth in expenditures there has been increasing competition for revenues on the part of the various layers of Government. The following table shows this growth at a glance :

TABLE I
GOVERNMENT EXPENDITURES AND REVENUES IN CANADA ¹
(Fiscal year nearest to calendar year)

A. Expenditures								
	\$ millions						Percentage Increase, 1940 over—	
	1913	1921	1926	1930	1937	1940	1913	1937
Dominion .	131	381	314	419	514	1278	875	149
Provincial .	49	91	127	188	261	276	463	6
Municipal .	100	206	240	285	232	279	179	- 1
Total .	280	678	681	892	1057	1833	554	73
The relatively large increase in Dominion expenditure as compared with those of Provincial and Local expenditures is striking. To meet these expenditures the following revenues were necessary :								
B. Revenues								
	\$ millions						Percentage Increase, 1940 over—

Total .	304	681	798	840	1056	1362	348	29

¹ The figures in this table are gross expenditures and revenues and do not therefore agree with the figures in the following tables, where net figures are given and double counting has been eliminated. The figures for 1940 are taken from *Comparative Statistics of Public Finance, 1936-1940*, compiled for the Dominion-Provincial Conference of Jan. 1941, on the same basis as those of the Rowell-Sirois Report.

The table also brings out the effect of the war in further increasing the preponderance of the Dominion and in creating a substantial Dominion deficit. This is further illustrated by Table II in which Government revenues and expenditures are compared with the national income. It also shows the growing importance of defence expenditures.

Consumption Taxes. The shares of Dominion, Provincial and Municipal Governments are shown. The classification is, as explained in Chapter II, not an ideal one but the best possible to bring out the characteristics of a Federal system of taxation. No clear line of demarcation is possible in every instance. [Thus the taxation of foreign dividends in recent years may be classified as a tax on income or as a tax on corporations. Although Dominion loans are exempt under the Act, Provincial Government loans are not, and if the tax on foreign dividends were placed in Group III under business taxes this fact would have to be remembered. Again, taxes classified as progressive are not always completely progressive in all incomes. Very high rates are levied on large incomes and on large estates, and less is taken from medium incomes and medium estates. Canadian taxation is progressive as between medium and large incomes, but, at any rate in 1937, regressive as between small and medium incomes.]

As in the previous chapter it is convenient to express the data in the above tables in the form of percentage showing the percentage share of each Government in each tax and also the percentage which each tax bears to the revenue of each Government. This is given in Table IV.

From Tables III and IV the following characteristics emerge. The tax system is predominantly regressive. The Dominion Government, for example, has a very productive source of revenue in a comparatively high sales tax. This tax in 1937 yielded \$138 millions out of a total Dominion revenue of \$465 millions, as compared with \$112 millions from customs and \$52 millions from excise. In the second place, only 10 per cent of the total taxation of Canada (all Governments) is in the first group — progressive taxes. [The personal income tax produces only 11 per cent of the Dominion revenue and 5 per cent of total Provincial revenues. This was the position before the war. These percentages require further analysis in order to see how far the principle of progression is applied. Three-quarters of this 10 per cent comes from incomes over \$10,000 and proportionately large estates and 35 per cent from incomes of \$50,000 and over. The Dominion income tax in 1937 was, on very large incomes, one of the highest in the world, and when combined with Provincial income taxation in the four Western Provinces was perhaps the highest in the world. In Alberta, for example, the combined Dominion-Provincial income tax reached, before the war, 105 per cent of the total income of \$1 million. A table given below and published in the Report¹ shows a variation on the highest incomes varying from 33 per cent of the total income in Nova Scotia (Halifax) and Quebec to 58 per cent in Saskatchewan (Regina). In addition to these differences there are also major differences in

exemptions and in the determination of taxable income. An equitable tax in every sense of the term is almost an impossibility, but when the variations are as great as those quoted they are very unsatisfactory from the individual taxpayer's point of view. It cannot be said that tax justice obtains where an individual is taxed twice on the same income by two taxing authorities, such as, for example in Alberta and British Columbia where the income paid to the Dominion is not allowed as an exemption. The following table shows the percentage of the gross income taken in British Columbia and Alberta in contrast with the percentage taken in Ontario, where the provincial rate is half the Dominion rate and where the income tax paid to the Dominion is allowed as an exemption :

Source.—Report of the Royal Commission on Dominion-Provincial Relations, Book II, p. 158.

It is clear that equity as between individuals and as between different regions is not possible in such circumstances. It was for this reason that the Royal Commission recommended that among other things the Dominion should be conceded the exclusive right to levy taxes on personal incomes, a recommendation accepted by the Dominion Government. An income tax for the Dominion as a whole could not otherwise be developed. Six Provinces and a number of Municipalities were levying income tax in addition to the Dominion. The Dominion has made good, as will be seen below, to the Provinces the revenue from income tax previously received by them from that source. For the duration of the war all the Provinces concurred with this arrangement.¹

If, as recommended by the Royal Commission, the taxes which lend themselves most readily to progression (viz. the personal income tax and succession duties) were (permanently) entrusted to the Dominion Government and made uniform throughout Canada, each Provincial Government would be in a position to provide directly or through Local Authorities normal educational and other social services and development without having to impose very heavy taxation. The most outstanding inequality in Canadian taxation is territorial, and it is in the least wealthy Provinces that the percentage of taxes to total and surplus income is highest. With the Dominion Government in possession of the progressive taxes *par excellence* it would be possible to find the funds for the National Adjustment Grants, payable to those Provinces whose need is great, without resort to types of taxes which reduce the national income. At the same time there is the danger, a real danger in a Federation, of centralisation leading to the loss of real provincial self-government. This is analysed further in Chapters VIII and IX.

The high regression of the Canadian system before the war is well seen from the high proportion of taxes on consumption (Group IV) and also of those taxes in Group III which are not levied on income. The high regressive nature of the system is also seen in an examination of the taxes in those groups. Thus the Canadian sales tax of 8 per cent takes a much higher proportion of income than the sales taxes of most other countries. It has been estimated that it takes from $3\frac{1}{2}$ to $5\frac{1}{2}$ per cent of the income according to the distribution of consumption. Its great merit is its productivity. On the other hand, while it collects for the Government 8 per cent of the manufacturer's price, it takes from the ultimate taxpayer approximately the same percentage of the retail price. The tax is pyramided, since each buyer calculates his profit on the price at which he buys, a price which includes the tax.

¹ In the Budget for 1942-43 the Dominion Government assigned \$84,428,000 to the Provinces as compensation for their loss of income tax.

Another criticism of the Canadian revenue system is that the burden of taxation is on costs rather than on surplus. Taxes which increase costs of production tend to eliminate the marginal firm or industry and to interfere with investment. The result of the tendency of marginal firms to disappear and of the tendency of potential investors to refrain from engaging in new enterprises, is that both labour and capital resources will be thrown out of employment and that the national income will be correspondingly diminished. Out of this diminished national income a larger revenue than before will have to be raised, as the unemployed will have to be maintained at the public cost. If, in order to raise the larger revenues, new taxes are imposed which bear on costs, the vicious circle will be completed. The alternative to taxes which increase business costs lies in taxes falling on profits or other surpluses. In the long run this means that the latter taxes should be replaced by an expansion of the personal income tax.¹ Among taxes on costs are the taxes in Group IV and also taxes on corporations in Group III other than those on net income, because they have to be paid regardless of the fact that net income has been earned or not — such as taxes on capital stock, the number of branches and other fixed taxes on corporations. In short, the Canadian system has been criticised as not collecting a given amount of revenue with the least burden on the national income. The very high proportion of the tax burden that falls on costs rather than on profits, together with the lack of co-ordination in tax policy among the competing tax authorities, reduce the national income by restricting marginal investment, production and employment. Three-quarters of the total taxes before the war have no direct relationship to net income and at any rate, under the pre-war division of revenue powers, could not be so adjusted.

Lastly, as will be seen, the revenue sources of the Provinces and the Municipalities are limited, while within the framework of the Constitution these layers of Government have a very important position especially with respect to social security. This means that they cannot efficiently perform what is in this respect required of them. The position is all the more difficult because of the load of dead-weight debt which the Provinces and Municipalities carry, the equivalent of one-fifth of the total Municipal-Provincial expenditures. The shares of the Provinces and Municipalities in the various revenues are shown in the following table :

¹ Report of the Royal Commission on Dominion-Provincial Relations, Book II, p. 161. As to the extent this has been achieved in Dominion war finance, see section on The Canadian Economy in War-Time — section vii below.

¹ These figures are based on those in Book III of the Rowell-Sirois Report, whereas Tables III and IV are based on those in Table 84, p. 211 of Book I. The two sets of figures differ in their classification of revenues, though not in the totals.

² Particulars not available ; included under " Other Licences, Permits and Fees ".

PROVINCIAL REVENUES

The detailed table showing the data for each Province is given in Part III of the Enquiry (Table 5). Considerable care has to be taken in comparing these, as they have to be analysed in relation to the Provincial income, especially the free or taxable surplus income and the amount of services supplied by governmental agencies. There are other special

circumstances to be considered in making comparisons between Provinces, as these differ so much in the division of responsibility for the social services, including education, and for the upkeep of roads. Not only does the proportion borne for each of these services by Provinces differ widely in the same year but also in the same Province between different periods. In Prince Edward Island, for example, where there is a small agricultural economy combined with a lack of industrial and urban development, there is a Federal subsidy three times the average *per capita* for all Provinces and one-third of the total Provincial-Municipal expenditures. In Nova Scotia small-scale subsistence industry and a vulnerable economy make for low taxable capacity. As compared with other Provinces, the low return from property taxation and the relatively high proportion of revenues from the Federal subsidy are striking. In New Brunswick, "the best-watered country in the world", as in the other Maritime Provinces, real property taxation is below the average and progressive taxation is negligible. The latter is left to Municipalities and levied on a frequently arbitrary assessment at the local real property tax rate with exemptions varying according to local conditions. It combines a small poll tax and a rough approximation of a property tax. In Quebec, which conforms to the average revenue system, income and sales taxes are levied by Municipalities rather than by the Provincial Government. Developed progressive taxes are absent from Provincial income. The Church has a unique position in Quebec, since it carries out functions, *e.g.* in education and social welfare, performed in other Provinces by Provincial and Local Governments. Hence the Quebec taxpayer contributes more for such services than appears from the public accounts. This falls especially on real estate, partly because the greater part of church property is exempt from taxation. This is also one of the factors which have caused some Local Authorities to turn to income and sales taxes and to corporation taxes (licences and fees). In Ontario, in 1937, subsidies from the Dominion Government were less than 2 per cent of Provincial-Municipal revenue, and Provincial subsidies to Municipalities are 20 per cent of those. Since the depression Quebec's financial position has suffered, as its economy depended to a large extent on world trade. Ontario's tax policy is affected by Federal tax policy to a greater extent than in other Provinces, and in progressive taxation her action is limited to Federal policy. The high level of property taxation has provided the Municipalities with considerable revenue. The revenue system of Manitoba is one of the soundest in Canada. Not only is the yield of real property taxation large, especially in Winnipeg, but there is an emphasis on direct taxation such as the Provincial income tax and succession duties. In 1937 these were 20 per cent of total Provincial revenues. This is perhaps due to a

large portion of Prairie surplus revenue being centred in Winnipeg. The *per capita* income of Saskatchewan is, with the exception of Prince Edward Island, the lowest in Canada. There are no urban centres or corporations in the Province where surplus income accumulates and consequently Provincial taxation is unsatisfactory. In emergencies the existing system, depending as it does on a major industry, wheat, is in a particularly unfortunate position. The tax sources tend to yield much less than the Canadian average. The sales tax, however, is an effort to broaden the basis of taxation and has been productive to a degree few other taxes could have been in the circumstances. In Alberta the Provincial real property tax still prevails, as in Saskatchewan, to a distinctive degree. Progressive taxation in spite of high rates is below the average for all Provinces. Corporation taxes were increased during the period under review on grounds perhaps other than of revenue. The *per capita* revenue of British Columbia is nearly double the Canadian average. Municipal revenues there are at the Canadian average although the proportion of municipally organised areas is much smaller than in most Provinces. Corporation taxation and revenues from the public domain are three times the Canadian average. British Columbia is rich in resources and to exploit these resources corporation organisation is greatly developed. The high Provincial income makes it possible to provide Government services well above the average Canadian standard.

This brief survey of Dominion, Provincial and Municipal revenues would be incomplete without some reference to the revolutionary changes in the economic and social role of Government which have necessitated an immense increase in Government revenues and new kinds of revenue. The proportion of the national income spent by Governments has risen from less than 10 per cent at Confederation to 25 per cent or more in 1937, and taxes used in 1874 would have provided but one-half of all Government receipts in 1937, including the property taxes which have continued to support almost the whole of the great increase in Municipal services. The Dominion Government has expanded its income by a heavy sales tax, by the taxation of business and by the personal income tax, the fairest of taxes. In 1937 the Provinces, which had been given power to levy direct taxation, receipts from the public domain, licences and fees, and were expected to rely to some extent on fixed unconditional Federal subsidies under the Constitution, obtained less than one-fourth of their income from these sources. The great bulk of new sources for the Provinces could not have been foreseen at the time of Confederation, sources which have been interpreted as falling within Provincial jurisdiction. In the words of the Royal Commission, "Some of these sources are directly competitive with those employed by the Dominion ; many of the others constitute

onerous or uneconomic levies on consumption and the costs of production''. With the joint occupation of the field of direct taxes, neither the Dominion nor the Provinces nor both together have been able to employ the progressive taxes to the extent which is economically and socially desirable. It is clear that the present situation in Canadian public finance represents a wide departure from the conception of the Fathers of Confederation and from the spirit of the financial settlement which they devised. Costly Government responsibilities which have become national in scope are being supported by Regional and Local revenue. Revenue sources which have become national in character are being employed by Regional and Local Governments to the complete or partial exclusion of the Central authority.¹ It is interesting to compare these views with the position that has resulted from the war.²

IV. PUBLIC EXPENDITURES BEFORE THE WAR

Next we turn to public expenditures. The most outstanding features of the division of Government expenditures between the Dominion, Provinces and Municipalities in 1937 are brought out in the following two tables, VII and VIII, on pp. 88 and 89.

The main features of these tables are as follows :

(1) The large recurring expenditure on debt charges — 27 per cent of the total expenditure of all Governments, and 61 per cent of the total is on Dominion debt.

(2) The primary functions of Government, including debt charges, account for 52 per cent of the total, and the secondary functions — the social services and development including transportation — account for the remaining 48 per cent.

(3) Relief expenditures, mainly unemployment but also advances to farmers, are the legacy of the great depression. Excluding debt charges they account for 13 per cent of the expenditures, but including debt charges for this function alone they account for 15 per cent of the total.

(4) Development, including transportation, accounts for 12 per cent of the expenditures excluding debt charges, but 30 per cent including developmental debt charges ; from 1867 onwards the main object of public loan policy has been the provision of transportation facilities, railways, canals, public works and harbours. The unification of railways, waterways and harbours was the enormous task of the Dominion Government under the British North America Act, 1867. With the advent of the motor car millions of dollars have been spent on the construction of roads.

¹ Report, Book I, chapter viii, pp. 245-6.

² See section vii below, page 93.

The detailed tables of relief expenditure on current and capital account will be found in Part III of the Enquiry (Tables 8 and 9). They show as clearly as the noonday sun the remarkable effect of the economic blizzard of 1929-32 on Dominion finance and on the finance of the nine Provinces.

The fall in the price of wheat was an uncontrollable external factor, and this, with internal rigidities of overhead costs, brought great distress. Tariff policy, directed to maintain employment in certain regions, threw an even greater burden on primary producers. Local vested interests sprung up and depression burdens were very unevenly distributed. The increase in "Other Public Welfare" (old-age pensions, hospitals, asylums

and public health) was only in part due to the depression. It was also due in large part to the economic and social evolution which is taking place in Canada. When the Act of Federation was passed, the provision of minimum social standards was never contemplated, nor was the transfer from Municipalities to the Dominion Government of a large part of the cost. The effect of large transfer expenditures¹ on the distribution of the national income and on the tax structures has sometimes been overlooked. It resulted in the collapse of the once accepted division of powers in a Federation; it shattered the old theory that the individual should be responsible for his own welfare and that of his dependants.

V. THE PUBLIC DEBT OF CANADA BEFORE THE WAR

An analysis of the public debt of Canada for the year 1937 shows clearly the large amounts incurred for developmental purposes and in recent years for public welfare. The total debt of all Governments was \$7863 millions, and of this \$1413 millions was represented by liquid assets (e.g. cash), investments which were completely self-supporting and the capitalised value of interest earned by partially self-supporting assets. The following table shows how the balance of public debt was incurred :

¹ In 1937 transfer expenditures of all Governments, i.e. expenditures on public welfare, mainly unemployment relief and war pensions, and interest on unproductive debts, were \$406 millions out of a total expenditure of \$996 millions.

The interest on this debt was \$271 millions,¹ or about 27 per cent of all Government expenditures. Of this \$100 millions was the cost of servicing accumulated deficits, war expenditures, capitalised unemployment relief and capitalised losses. The balance, \$171 millions, was paid on debts incurred for development.

VI. THE ROYAL COMMISSION ON DOMINION-PROVINCIAL RELATIONS

This section of the chapter would be incomplete without a reference to the recommendations of the Royal Commission on Dominion-Provincial Relations, 1940.² These have been accepted by the Dominion Government. At a Dominion-Provincial Conference held in Ottawa in January 1941, the premiers of three Provinces — Ontario, Manitoba and British Columbia — suggested postponement until after the war. As already noted, an Unemployment Insurance Act for the whole of Canada has been passed, and the Provinces have withdrawn during the war from the field of personal income taxation. The Royal Commission held that the maintenance of the employable unemployed could not be efficiently performed on a Provincial basis or by Local Authorities. In this view the Commission agreed with the National Employment Commission and La Commission des Assurances Sociales de Québec. They were also of opinion that assistance to farmers when operating cost advances had to be given in times of widespread disaster, and could not be left to these Governments. The Dominion Government, therefore, should assume direct administration

¹ Excluding provision for amortisation.

² See Appendix I for Summary of Recommendations.

and financial responsibility rather than render indirect assistance by way of advances to the Provinces. The administration of non-contributory old-age pensions, to which the Dominion Government was already paying as high a proportion of the cost as it reasonably could without assuming control of the administration, should continue to remain with the Provinces, and no further financial help was recommended. If, however, non-contributory old-age pensions were to be superseded or supplemented by a contributory system, the Commission recommended that such a system should be under the control of the Dominion. It was also suggested that the Dominion should take over all Provincial debts and that each Province should pay to the Dominion a sum equal to the interest which it now receives from its investments. In view of the peculiar case of the Province of Quebec, where the *per capita* debt is low as compared with that of other Provinces on account of the fact that the Municipalities perform duties discharged elsewhere by Provincial Governments, the Dominion should take over 40 per cent of the combined Provincial and Municipal net debt. The Provinces should surrender their subsidies and receive an annual national adjustment grant which should be appraised by a small permanent Commission (which might be called the Finance Commission) assisted by an adequate technical staff. The system of grants should be reconsidered every five years and would be irreducible during this period. For special emergencies, as in the case of Saskatchewan, special provision would be made annually.

The Provinces on their part would renounce the tax on personal incomes and taxes imposed on corporations which individuals or partnerships carrying on the same businesses as the corporations would be required to pay. This transfer would include all such taxes, except a bona-fide licence fee which would remain with the Province. The Provinces should also forgo various forms of succession duty. This would put an end to grievances that the differences of rate in the various Provinces where such duties are levied are inequitable and distort investment because of the differences in rates between Provinces and the dangers of double taxation. Many Provinces, it was held, had a grievance because estates built up by investment throughout Canada were taxed not for national purposes but for the benefit of favourably situated Provinces. Finally, the existing Dominion subsidies to the Provinces would be abolished and replaced by the system of grants recommended by the Commission.

VII. THE CANADIAN ECONOMY IN WAR-TIME

Canada's war-time economy falls into two periods — that prior to May 1940, when the Dominion was called on to supply increasing

quantities of food and raw materials, and the period subsequent to that date when Canada became in addition a supplier of large quantities of explosives, chemicals, shells, small-arms ammunition, bombs, tanks, vehicles, aircraft, ships and other munitions of war. It was natural, therefore, that the War Supply Board should have been superseded in April 1940 by the Department of Munitions and Supply which has had such an important part in the acceleration of the war effort in all directions. It remodelled the Canadian economy to meet the intensified needs of the Allies after France fell. When it was decided that the Dominion Government should finance and own the required capital equipment, the Department came forward with a programme of capital assistance to industry by which the greater part of capital equipment has been achieved after June 1940. Not only have new factories been erected, equipped and financed, but private concerns have been enlarged and machinery labelled as Government property installed in privately owned factories. Branches within the Department of a quasi-autonomous nature were also set up to deal with all kinds of munitions production, and these, with two other forms of administration — Controllers and Government Corporations — have been made the chief means of organising the Canadian economy for war. The War-Time Prices and Trade Board, the National Labour Supply Council and the Department of Finance have also assisted in the supremely important task of war regimentation.¹ In 1943 war production had reached a remarkably high level. In January 1943 the business placed by the Department of Munitions and Supply exceeded \$6 billions. In 1942 war industrial production was at the rate of \$2.6 billions, and for 1943 it is estimated to reach \$3.7 billions. In 1942 one-half of the output of munitions was sent to the British theatre of war and to Russia, and 20 per cent to the United States and Pacific war zones, including China. War production was the main reason of the increase in the net national income to a new high record — \$7.5 billions in 1942 as compared with \$4.6 billions in 1939, an increase of no less than 61 per cent. By 1943 the country's productive capacity was no longer adequate to support a parallel expansion in the output of both munitions and consumers' goods. The production of the latter, therefore, had in an increasing degree to be held in check by a system of controls and priorities, including the direct control of prices and production, and by the restriction and diversion of civilian expenditures by taxation, thereby releasing resources required for war purposes. Finance in war-time provides the money required to

¹ Cf. *Mobilizing Canada's Resources for War*, Plumtre (Toronto, The Macmillan Co., 1941); *Canadian War Economics*, edited by Parkinson (Toronto, University of Toronto Press, 1941); "War Finance and the Canadian Economy, 1914-20", *Deutsch Canadian Journal of Economics and Political Science*, vol. vi (1940); *An Approach to War Finance*, Plumtre, *op. cit.* vol. vii (1941).

mobilise the human and material resources for war and prevents the spending of money on non-war purposes so that civilian activities do not interfere with or frustrate the war effort. The State, therefore, must tax adequately as well as it must borrow the savings of both individuals and companies or corporations. It must sometimes expand or add to credit and currency by borrowing from the banks; and if there is not full employment such expansion may be helpful, since it may stimulate production without inflation. If production is getting to its maximum and industry cannot expand, more credit or currency will result in an increase, not in production, but in prices.

The outstanding features of Canadian public finance in war-time, as will be seen from the tables in Part III, are :

(1) The great growth in *Federal* (or Dominion) expenditures, which in 1943 was eight times above the pre-war level.

(2) The enormous increase in *war* expenditures.

(3) The growth in *Federal* revenues, most noticeably in the taxation of personal incomes and the incomes of corporations, in federal succession duties, in customs duties and excise duties, especially on liquor and tobacco, and also in sales taxation; the burden of personal income taxation is greater than that of the United States and similar to that of Great Britain. This emphasis on progressive taxation is one of the most interesting changes in Canadian war finance.

(4) The withdrawal of the Provinces from the field of personal income and corporation taxes during the war. In 1943-44 the compensation paid to the Provinces was \$84 millions on this account.

(5) The policy of the Federal Government to meet half the expenditure from taxes and half from borrowing.

(6) The comparative stability in provincial and in municipal finance as compared with the remarkable changes in Federal finance.

(7) The increase in the Dominion Public debt from \$3153 millions in the pre-war year to \$6182 millions (net) in 1942-43,¹ despite the great decrease in sterling indebtedness as the country turns from being a debtor to a creditor country. It is true that Canada in 1943 is running up a debit balance with the United States, but this process has, since the Hyde Park Agreement of 1941, slowed down. Under this agreement the United States charges to its British Lend-Lease account such exports to Canada as are to be used for Canadian war products exported to Britain, and the United States buys more from Canada. Meanwhile Canada accumulates sterling balances on a large scale. By December 1942 the total sterling

¹ For 1943-44 the borrowing needs were estimated at \$2748 millions. The third Victory Loan of Oct. 1942 had a minimum objective of \$750 millions, but produced \$991 millions from 2 million subscribers.

balances had reached \$2770 millions. Of this over \$800 millions were used for repatriating sterling debt, public and otherwise. \$250 millions were covered by British sales of gold to Canada, and the remaining \$1700 millions, by an interest-free loan to Britain of \$700 millions and by a gift of \$1000 millions made early in 1942 under the United Kingdom Financing Act. This sum of \$1000 millions was included in the Dominion expenditure figure. A similar gift of \$1000 millions was put into the Budget for 1943-44.

In Part III of this Enquiry Canadian Tables 1 to 4 and 7 show the tax structures, public expenditures and the public debt of Governments in Canada after the outbreak of war. It will be noted how great has been the increase in the total expenditures of all layers of Government. Before the war this was 25 to 30 per cent of the national income and often included large expenditures for urban and agricultural relief. In 1941-42 the deficit of the Canadian national railways disappeared and there was also a fall in the expenditure on unemployment and relief, now a small item. The demands made on the railways during the last three years have already much exceeded the operations of the first world war, and in 1942 the increase over 1939 was of the order of 60 per cent. The increase in the returns of the sales tax, a regressive tax, in 1942-43 and 1943-44, was noticeable. Thus in 1938-39 the Federal sales tax was \$122.1 millions, the Provincial sales taxes \$2.4 millions and the Municipal sales taxes \$4.3 millions, or a total of \$128.8 millions. In 1942-43 the yield was \$218, \$14.7, \$6.7 and \$239.4 millions respectively. Other Federal regressive taxes also increased, thus miscellaneous Federal taxes increased from \$22.9 millions in 1938-39 to \$76.8 millions in 1943-44.

The most striking changes brought about by the war are summarised opposite and overleaf.

The figures show that the expenditures on education and highways have not decreased or remained constant on account of the war. The large expenditures on public welfare have, owing to the better employment, decreased in 1942-43 as compared with the pre-war year 1938-39.

It will be seen from what has been said that the war has been financed by taxation, by borrowing from the public the savings of individuals and corporations and also by credit expansion under the banking system. These methods have been supplemented by special controls such as import quotas and prohibitions, price-fixing, exchange control and rationing. The Government realised early in the war the advantages of taxation and of skimming off the savings of the people and corporations. The war effort would have been sadly cramped had civilian demand been allowed to compete with war requirements both as regards man-power and materials. An all-out war effort and a rising standard of living are not good bed-

fellows. At first the financing of the war was of a credit expansion nature, as when, for example, after the outbreak of war a loan of \$200 millions was raised from the banks. A controlled expansion of credit was desirable to assist production and to decrease unemployment which was 12 per cent,¹ but once this took place a public loan for \$200 millions was floated and in the second war Budget heavier taxation was levied. A second

¹ The percentage of total wage-earners unemployed was 2 per cent in 1928, a maximum of 26 per cent in 1932, 9 per cent in 1937 and 12 per cent in 1939 (Dominion Bureau of Statistics — The Unemployment Situation).

public loan for \$300 millions was successfully floated. Early in 1941 a short-term loan for \$250 millions from the banks was raised. In the third war Budget heavier taxation was levied with a Victory Loan offered to the public in June 1941. This was successful. The tax structure, however, has been made to bear the maximum load, and the taxation of incomes, corporations and excess profits but not the sales tax (because it is regressive) have brought in much grist to the mill. On 23rd June 1942, for example, very sharp increases of income and national defence taxes took place and were henceforth to be collected at source wherever possible. The tax was steeply progressive. Exemptions for married persons and children were lowered but a proportion of the tax was treated as compulsory savings returnable with 2 per cent interest after the conclusion of hostilities. A married man, for example, with two children and an annual income of \$5000 who hitherto paid \$735 had to pay \$1062 as income tax and compulsory savings. In March 1943 "pay as you earn" was introduced but without complete cancellation of the balances due on last year's taxes. Only half of the tax liability on the earned income of individuals (but not of corporations) and on income from investment up to \$3000, for the year 1942, was "forgiven", and of the amount remaining one-third had to be paid by 30th June and two-thirds on 31st December 1943. Half of the income tax on investments for 1942 was deferred until the death of the taxpayer on the basis that, while wages and salaries cease on death, there is capital from which to pay deferred taxes on the death of the taxpayer. Special concessions were given to farmers. They paid tax on only two-thirds of their estimated income before the end of the calendar year, and the balance was to be paid when the actual income was established by the end of March 1944. Farmers when suffering a loss in any year may deduct from the income in either of the next two years.

The financial policy laid down in the first war Budget in September 1939 is being followed: (1) the pay-as-you-go policy as far as is practicable; (2) the insistence of the principle of equality of sacrifice on the basis of ability to pay; and (3) the levying of taxes to the highest possible point. Taxes could not be carried beyond that point where production efficiency would be interfered with, "but", said the Minister of Finance, "we are not prepared to be timid or light-hearted in judging where this point lies". This principle is seen not only in the taxation on the income of individuals but also on the taxation of corporate incomes where the rate has been raised sharply. In the Budget presented in June 1942 an interesting change was made. Previously company profits were first subject to a flat rate of 18 per cent corporate income tax, and then paid 75 per cent of the excess profits under the Excess Profits Tax Act over the standard profits or 22 per cent of the total profits, whichever was the

greater. Now under the new Excess Profits Tax Act a company pays a flat rate of 12 per cent on its total profits in addition to the 18 per cent corporation income tax, and thereafter 100 per cent of excess profits or 10 per cent of its total profits, whichever is the greater. This means that the 100 per cent excess profits tax becomes the greater when the company earns more than 116·6 per cent of its standard profits, compared with 156·7 per cent under previous legislation. A company or corporation as before pays at least 40 per cent of its total profits in taxation. It cannot retain under the new legislation more than 70 per cent of its standard profits as calculated for purposes of excess profits tax. Standard profits are calculated after payment of income tax. It is, therefore, estimated that, allowing for the 20 per cent refund or excess profits tax, a corporation with standard profits at the level of the 1936-39 average taxable profits can retain about seven-eighths of its average profits for those years, the years on which the standard is based. The tax refund has borne income tax and is payable without interest after the war.

A conspectus of Canadian public finance is given in a table furnished by the Dominion Statistician, Ottawa, showing the revenues and expenditures of the war years, as compared with those of the pre-rearmament year 1937-38, expressed as a percentage of national income and per head of population, together with the war expenditures also expressed as a percentage of national income and per head of population. This will be found in Part III, Table 11. It shows that in 1941-42 as compared with 1937-38 Government revenues (Dominion, Provincial and Municipal) had increased from 25·6 per cent to 32·3 per cent of the national income, Government expenditures from 25·7 per cent to 37·9 per cent, and the expenditure on the war from 0·7 per cent to 21·2 per cent, a truly remarkable change in Canadian public finance.

VIII. CONCLUSION

To-day Canada is the most highly developed Dominion both industrially and financially. The advance which the Dominion has made in recent years, especially since the Bank of Canada commenced business in March 1935 after the passage of the Bank of Canada Act in 1934, is most striking. A quarter of a century ago Canada was without a broad tax structure and there was no domestic money market from which to borrow. There was no central bank to control or to co-ordinate the financial life of the country.¹ Before the outbreak of the present war Canada no longer depended on London for loans as in 1914, for in that

¹ Cf. Plumptre, *Central Banking in the British Dominions*, Toronto University Press, 1940.

year, be it remembered, less than \$1 million of Canada's funded debt was held by Canadians. Between 1914 and 1920 Canada's war expenditures rarely exceeded 10 per cent of the national income, and her tax structure was in 1939 no longer the primitive tax structure of customs and excise duties of twenty-five years earlier. Nevertheless war expenditure was only a fraction of 1 per cent before the outbreak of the present war, and this is a rough measure of the unpreparedness of the Dominion for total war. The war expenditure increases described in the previous section are almost too great to be believed. These have been possible because of the large real resources of the country of man-power and equipment. Employment of each of these since September 1939 has been upward, as may be measured by the increase of national income as long as that is an increase of real production and not only an increase in prices. Diminished consumption for non-war purposes and diminished investment in new equipment were other real sources of Canada's war effort. The tax structure was improved beyond all recognition to meet the new expenditures. To distribute the burden of war as fairly as possible a resort to direct taxes was made. Before the war more than two-thirds of all tax revenues came from indirect taxes. To-day, on the other hand, more than half is from direct taxation (personal income taxes, the national defence tax, the corporate income tax, the excess profits tax less payments to provinces for tax transfer, succession duties, and taxes on dividends and interest). Canadian taxes on personal incomes are higher than those in the United States and more or less conform to those in Great Britain. The increase in progression through income taxation is very noticeable. But the burden of indirect taxation is, all things considered, heavier in Canada than in Great Britain (Table 11, Part III). New taxes to restrict incomes have been levied. Among these are the excess profits tax, the national defence tax, succession duties, a gasoline tax, a passenger transportation tax and entertainments taxes on motion pictures. Other taxes to conserve resources include the automobile tax, the tax on radio valves and wireless sets. The whole policy of Canadian war finance, as illustrated in what has been said above, is best summarised in the Minister of Finance's own words in the Canadian House of Commons: "The task of finance is to provide the funds which are used to pay for war services. But in a deeper sense the task of finance is, by taxation and borrowing, to restrict the civilian demand for economic resources in order that they will be free when the defence or supply departments need them. . . . If finance proceeds more rapidly in curtailing civilian demand than defence proceeds in making use of the resources thus set free, there will be unemployment and waste, while, on the other hand, if finance lags behind the defence services, they will be faced by shortages and delays, and the competition between military and

civil demands will bring about inflation.”¹ Tax as high as you can and mobilise savings by an intensive campaign and avoid the inflationary gap brought about by bank borrowings, are the aims of the Dominion Treasury in 1943-44.

¹ The Hon. J. L. Ilsley, Canadian House of Commons Debates, 30th July 1940, p. 2272. Cf. Plumptre, *Mobilizing Canada's Resources for War*, Toronto, The Macmillan Co., 1941, p. 122.

CHAPTER V

THE PUBLIC FINANCE AND NATIONAL ECONOMY OF AUSTRALIA

I. THE NATIONAL ECONOMY

THE Commonwealth of Australia is over thirty-one times the size of the United Kingdom but has only about one-seventh of its population. Its size is roughly the same as that of the United States, but the United States has nineteen times Australia's population. As compared with Canada, Australia's area is about three-quarters of a million square miles less, but her population is approximately 7 millions as compared with Canada's 10 millions. Australia, however, owing to scarcity of rainfall, cannot support a population of anything like the size of that of the continental United States. The whole continent of Australia is a large and irregular plateau, part of which is below sea level. Round this plateau there is a mountainous coastline with intervals of sandy shores on the north, west and south. On the east coast there are good harbours and rivers, while in the west there is a coastline with poor inland water communication. Of the six States of the Commonwealth three are greatly superior to the other three in the production of wealth — Victoria, New South Wales and Queensland being much more prosperous on the whole than what may be called the marginal States — South Australia, Western Australia and Tasmania. This diversity in natural resources, size, population and state of development gives rise to differences of standards in financial administration as shown in the Budgets, even when these are corrected to make allowances for items brought into account in some but not in others, and adjustments made to eliminate the effects of emergency expenditure and variations in accounting practice. These differences are mainly in (1) the standard of expenditure in regard to the costs of administration and the scale of social services, (2) the maintenance of capital equipment and (3) the taxable capacity of the States and the standard of effort by the States and Local Authorities in raising revenue.

Population cannot be settled in vacant spaces unless there are available resources. Unless there is a rainfall of about ten inches in the area, cultivation is hardly possible. Wheat cannot be successfully grown if the rainfall is below ten inches, and settlement is impossible unless minerals or some special industrial or commercial opportunities exist. Methods of dry farming with an annual rainfall of this amount, eight inches falling within the growing period, and wheat-breeding have made it possible to grow wheat under difficult conditions, and the discovery of plenty of land

suitable for the merino sheep — Australia is the chief producer of wool in the world — has led to the production of much wealth from arid and semi-arid areas. In Queensland, New South Wales and Victoria the rainfall, which is much heavier between the mountains and the coast than it is on the inner side of the Divide, varies in the coastal belt from 160 inches a year in Northern Queensland to 25 inches in Western Victoria. In Queensland sugar, wool, tropical fruit and dairy produce are the chief products ; in New South Wales wool, wheat, dairying and the production of fruit are the main primary industries, while in Victoria wheat-farming, wool-raising and dairying with cultivation of vines and citrus fruits in the Murray irrigation areas and of apples in the south are the chief occupations. Cattle and sheep are grazed, and forestry is carried on among the foothills of the Great Divide. On the plateaus mining and cattle-grazing are the chief industries.

When we turn to the marginal States we see the mistake made by Australians and outsiders alike of overestimating the natural wealth of the continent, although the achievements in developing pastoral and wheat-growing industries have been noteworthy. In the marginal States there is a large area which is difficult to cultivate and to develop. South Australia, out of a total area of 380,000 square miles, has an area of 311,000 square miles with a rainfall under 10 inches ; Western Australia, out of a total area of 976,000 square miles, has 487,000 square miles with a similar rainfall. Tasmania, although her rainfall exceeds in parts 100 inches per annum and in no part is less than 20 inches, is mountainous, particularly on the west, and the productive area is not large. One-third of the island has no population, and only over 6 million acres out of some 17 millions have been alienated. The economy of South Australia is based largely on wheat and wool produced under conditions more difficult than the average, and she is vulnerable to price depressions. She lacks coal, but in spite of this has retained a surprising amount of secondary industry. Western Australia also specialises in wheat and wool, and in addition in the production of gold. Unfortunately her finances have been seriously affected by reckless financing of wheat in an area well suited for this crop, and by an attempt to settle migrants in the extreme south-west for dairying. With a small population and limited resources capable of development, Tasmania has more difficult problems than those of the other five States. Her unproductive assets, for example, are a growing burden and her taxable capacity is low. Loan losses per head are relatively very high¹ and are a heavy burden on the State finances. Indeed they are much higher than those of South Australia and Western Australia. The main factors contributing to this are losses on railways, roads and bridges, and land settlement.

¹ See Table 15, Part III.

These variations in the economic position between States led the Commonwealth Grants Commission to lay down the fundamental principle that "Special Grants from the Commonwealth Government are justified when a State through financial stress from any cause is unable efficiently to discharge its functions as a member of the federation and should be determined by the amount of help found necessary to make it possible for that State by reasonable effort to function at a standard not appreciably below that of other States".¹ A Federation, in short, cannot work on a strict book-keeping system, and it must be elastic in providing for change by constitutional amendment and for co-operation in supplementing the Constitution. Financial adjustments are necessary in the case of the units against whom the financial scheme of Federation may work unfavourably. The Centre and units more fortunately placed must make their contribution to the common cause of Federation. It cannot be expected that each of the units, economically or geographically, can be identical, and national policy may affect some of the units more detrimentally than others. It is necessary for the Centre to intervene so that the citizens in the Federation should have a minimum standard of social and other services. In this way the financial inequality of the units is remedied and the effective working of the Federation made possible.

We have referred to the development by the States of a policy of protection to rural production through subsidies and similar assistance, a policy of extending and intensifying settlement. This was a policy for the development of primary industry by State assistance. It clashed with the claims of secondary industry for protection by tariffs. The tariff was used as an instrument of development because it tended to produce a larger population and a better balanced economy. It imposed, however, a burden on exports; yet in spite of it the main exports, wool and wheat, have increased. Tariff policy has raised the prices of protected goods, and these include the primary products butter, sugar and tobacco. According to the Commonwealth Grants Commission, "all sheltered products and activities, such as potatoes, bricks, transport and retailing, adjust their prices to the new level of costs. Unsheltered industry, which in Australia is predominantly export industry, is subject to world demand, and cannot raise its prices. In Australia, higher costs of consumption goods are nearly all passed on quickly, and often automatically, to wages and the costs of industry. It follows that the greater part of the cost of protection is passed on and finally borne, not by the consumer, but by the export industry."² States which have a large amount of unsheltered industry are Western Australia and South Australia, which had respectively

¹ Commonwealth Grants Commission, Third Report (F. 2251, 1936), Chap. vi, p. 75.

² *Ibid.*, p. 64.

60 and 47 per cent out of the total production of such industry in 1932-33 ; the percentage for all States was 35 per cent, for Queensland 24 per cent, for Victoria 29 per cent, for New South Wales 36 per cent and for Tasmania 39 per cent.¹ By unsheltered production is meant the production of primary products including minerals. Western Australia has always alleged that it is almost impossible to set up factory industries in competition with those of the Eastern States : Interstate free trade has exposed her infant industries to the competition of similar industries in the Eastern States. " If such industries ", the Government of Western Australia stated, " could have been established successfully, our population would have been greater, the avenues of employment increased, and the [State's] national income augmented to an extent that cannot be measured only by the excess cost of imports from the Eastern States." ²

The ideas behind the policy of protection which is followed by the Commonwealth, ideas typical of not always very clear protectionist arguments, are best stated in *The Australian Tariff, An Economic Enquiry*, by Professors Copland, Giblin and Brigden and Messrs. Dyason and Wickens.³ It is a report of an informal Committee invited by the Prime Minister to study the tariff problem. It pointed out that Australia's exports were primary products, the products of agriculture and mining, while her imports were mainly manufactured goods. Protection had conferred a double benefit. First, it had diverted resources from the primary industries where diminishing returns are in operation and where declining export prices would have resulted. Resources were diverted into secondary industry. A shift of the terms of international trade would have occurred without protection. To produce as great a national income under free trade as under protection it would have been necessary to expand primary industry already producing at increasing costs, and any addition to exports would, without doubt, depress prices. The issue did not, it may be noted, arise from protection to agriculture as in Great Britain, but from protection to manufactures. Secondly, the permanent policy of protection had added to the national income by increasing the share of wages where the largest number of people was supported on more generous lines. The tariff, in short, had subsidised labour at the expense of landowners. Opportunity for employment had increased and a higher standard of living was the result. " The advantage of protection

Copland, " A Neglected Phase of the Tariff Controversy ", *Quarterly Journal of Economics*, Feb. 1931. For a criticism of the Australian case see Anderson, " Protection and the Historical Situation : Australia ", *Quarterly Journal of Economics*, Nov. 1938.

is in the maintenance of a larger population than could have been expected at the same standard of living without the protective tariff.”¹ The Committee did not attempt to estimate the net benefit or the net burden to the six States separately and was unable to adopt the provisional estimates made previously by two of their number.² The Committee estimated that Australian products which are protected cost, in 1926-27, £36 millions, more than the same goods could have been imported for, duty free. Protected manufactured goods cost about £26 millions more than free imports and protected primary products about £10 millions, a total of £36 millions, or £6 per head of population.

“In so far as the establishment of secondary industry involves a subsidy from the community, which falls with especial severity on export industry, there is a clash of interest between secondary industry and the interests which depend upon primary industry. Moreover, the secondary industries tend to be developed in the Eastern States. These are nearer the great coal-fields, and have the larger populations, and as they had an early start, the modern tendency to concentration makes these industries even larger. The more sparsely settled outer States could never establish these industries except at great cost to themselves. As a result the clash between the interests of primary and secondary industries tends to grow into a conflict between the more closely populated Eastern States of Victoria and New South Wales and the sparsely settled marginal States of South Australia, Western Australia and Tasmania. Queensland occupies a middle position because of her enormous pastoral wealth, the small proportion of really arid country, and the high return of the sugar industry, protected by an embargo and price agreement which is now equivalent to a duty of about 250 per cent.”³ Table I overleaf shows the production by States in 1937-38.

Another noteworthy feature of Australian national economy is the high *per capita* income which prevails in spite of the policy of protection, and which is responsible for some of the arguments quoted above (cf. pp. 105-6). Australia belongs to the high national income group of countries, the other countries being the United States, Canada, New Zealand, Great Britain and the Argentine. With a population of only about 7 millions the national income in 1937-38 was £796 millions, or £113 per annum per head of the total population, or over £2 per week, a large figure. If the breadwinner alone be taken, Australia's national income per head, like others of the £2 a week group, is double that amount. But, however, this group contains only 10 per cent of the world's population. No

South Australia .	12.3	5.1	2.6	20.0	13.8	33.8
Western Australia	8.8	4.5	9.4	22.7	8.6	31.3
Tasmania . . .	4.4	1.6	2.3	8.3	5.4	13.7
Total . . .	109.0	82.2	32.2	223.4	196.5	419.9

* Compiled from data in Appendix 10, Commonwealth Grants Commission, Eighth Report (1941).

less than 81 per cent of the world's population has an average income per breadwinner below £2 a week, so that the world as a whole is poor in comparison with the first group of countries above. An intermediate group covering 9 per cent of the world's population includes the principal industrial countries of Europe with an average income per breadwinner of between £2 and £4 weekly.¹ Australia's income in 1937-38, the pre-*rearmament* year, was higher than in the pre-*depression* year 1928-29, and very much higher than in 1931-32. This is clearly brought out in the following table :

TABLE II
THE NATIONAL INCOME OF AUSTRALIA *

Year	National Income (£ millions)	Index Numbers (100 = 1928-29)
1928-29	768	100
1929-30	730	95
1930-31	566	74
1931-32	528	69
1932-33	550	72
1933-34	609	79
1934-35	632	82
1935-36	704	92
1936-37	760	99
1937-38	796	104
1938-39	788	103
1939-40	863	112
1940-41	925	120

¹ Cf. Colin Clark, *The Conditions of Economic Progress*.

The table also shows the effect of the change-over from a peace-time to a war-time economy. In 1939-40, for example, as compared with the previous year, there was an increase of 9 per cent, and in the following year of 8 per cent. Among the factors making for an increase, the most important was the great drive to increase the production of munitions of war with the consequent demand for labour and the rise in wages, especially in the industrial States of New South Wales and Victoria. The trend towards increasing productivity with the aid of machinery and the better organisation of labour-power and resources has been marked in recent years in Australian as in British industry. This has been specially intensified since 1939-40. On the other hand, there have been the adverse influences arising from the dislocation of overseas trade. Owing to war demands on shipping, Great Britain has been unable to absorb the normal imports from Australia. This has severely affected the States which were most dependent on primary production, such as South Australia and Western Australia in regard to wheat and Tasmania in regard to fruit.

Australia's prosperity, indeed her very existence, depends on making the most of her specialised resources and on exchanging them on as advantageous terms as possible for her other requirements. Australia, as we have seen, is the world's largest producer of wool, and she is also one of the world's important producers of wheat. Out of a total export trade of £A157·6 millions in 1937-38 the exports of wool amounted to £47·0 millions, wheat and flour to £26·9 millions, meat to £12·3 millions, butter to £10·8 millions, hides and skins to £6·2 millions, fruit to £6·0 millions and sugar to £4·0 millions. Of minerals export gold amounted to £13·9 millions, and lead and spelter to £5·7 millions. On the other hand, her imports were mainly manufactured goods which she could not make so cheaply. Of her imports from abroad, amounting to £114·0 millions sterling, some of the most important were piece goods £12·0 millions, motor cars, chassis, bodies and parts £7·8 millions, iron and steel £5·0 millions, electrical machinery, cable and wire £5·0 millions, motive power machinery other than electric £3·7 millions, drugs, chemicals and fertilisers £5·3 millions, tea £2·4 millions, tobacco, cigarettes and cigars £2·0 millions. The greater part of Australia's customs and excise revenue, normally over 60 per cent, is the result of the policy of protection, and this, it may be noted, makes it impossible to adjust revenue easily to meet the needs of the Commonwealth. Moreover, business conditions and, in war-time, shipping have a great effect on it, a much greater effect than on any other major branch of taxation. In 1930-31 customs and excise revenue fell by 32 per cent, while direct taxation, Commonwealth and State, actually increased in that year. Even inclusive of the sales tax

the fall in total indirect taxation in 1930-31 was 25 per cent. Incidentally, were the Commonwealth to confine itself to customs and excise it would be in an uncertain position, and as the Commonwealth Grants Commission has more than once pointed out, any nice adjustment of taxing powers to responsibilities would be impossible in practice.

Conclusions on the National Economy

Australia's economy is very dependent on international trade, which accounts for a considerable proportion of her national income. Her resources are such that she specialises on primary products, in several of which she is one of the world's biggest producers. Nevertheless, she has for a long time pursued a policy of high and increasing protection, especially to secondary industry. This has resulted in a more diversified economy. The national income is very high, but the policy of protection has intensified the effects of the great physical and economic differences between the more populous and prosperous States of New South Wales, Victoria and Queensland, and the marginal States of South Australia, Western Australia and Tasmania. These differences, together with financial policies that have not always been very prudent in the past, have necessitated financial assistance in the form of annual special grants from the Commonwealth to the marginal States. The grants are intended to enable these States, with reasonable effort on their own part, to provide social and other services at a level similar to that of the other States.

II. THE CONSTITUTIONAL BACKGROUND

By the Commonwealth of Australia Constitution Act, 1900,¹ which came into force in the following year, the Australian Parliament has the "power to make laws for the peace, order and good government of the Commonwealth with respect to (*inter alia*) taxation; but so as not to discriminate between States or parts of States".² At the time of federation the Commonwealth was given limited financial powers. It was granted under the Constitution (section 88) exclusive power to levy indirect taxation in the form of customs and excise. But under section 87, known as the Braddon clause, only one-fourth of the net revenue from these duties was allocated annually to Commonwealth expenditure during the years 1901 to 1910, the remainder being handed over to the States. Alternatively, it could have been "applied towards the payment of interest on debts of the several States taken over by the Commonwealth".

¹ 63 & 64 Vict. chap. 12, amended in 1928 by the addition of section 105A giving effect to the powers conferred on the Commonwealth by section 105.

² Section 51.

During the last war, however, in 1915-16, the Commonwealth levied a direct tax in the form of an income tax. Before this date, viz. in 1910-11, it had levied the land tax and in 1914-15 estate duties, both direct taxes. In 1930-31 its indirect taxing powers were extended to sales taxes levied on home-manufactured and imported goods. The Constitution gives the Commonwealth the widest taxing powers, both in direct and indirect taxation. The States, having agreed to assign to the Central authority under the Constitution customs and excise taxes (including sales taxes), have been left almost entirely with direct taxes. During the last four decades balance between the revenues of the Commonwealth and States has been maintained by recurring and non-recurring grants to the States from the Commonwealth which amounted during the period 1901-1941 to the large total of £385 millions.¹ In Federations, especially at certain stages of development, redistribution of revenue is to some degree inevitable, and Australia is no exception to the rule. Experience showed that inequalities as between the States occurred and it was found that certain States could not discharge, without assistance, their functions efficiently. The Commonwealth Grants Commission, under section 96 of the Constitution,² laid down the principle mentioned on p. 107 above.

In the pre-rearmament year, 1937-38, apart from invalid and old-age pensions financed by the Commonwealth Government and costing £15·8 millions, the Commonwealth made the following payments to or for the States: interest on States' debts £7·6 millions, sinking fund on States' debts £1·5 millions, special grants under section 96 of the Constitution £2·4 millions, Federal Aid road grants £4·1 millions, other grants £0·5 million: total £16·1 millions.^{3, 4} In 1942-43 invalid and old-age pensions were estimated to be £22·4 millions, and payments to the States from Consolidated Revenue £41·1 millions.⁵

At the various conferences of Commonwealth and State ministers and in the press it has sometimes been claimed that there has been invasion of a field of taxation reserved by the Constitution for the States. But a careful examination of the proceedings of these conferences and the reports of the Commonwealth Grants Commission as well as of the Constitution Act itself proves that no such invasion took place. There is

¹ Amount paid from Consolidated Revenue Fund, excluding payments for relief of primary producers, medical research, etc.

² Section 96 reads, "During a period of ten years after the establishment of the Commonwealth and thereafter until the Parliament otherwise provides, the Parliament may grant financial assistance to any State on such terms and conditions as the Parliament thinks fit".

³ See Table 19, Part III.

⁴ Excluding relief of primary producers.

⁵ Excluding relief of primary producers, but including £27·8 millions for income tax and entertainments tax reimbursement.

certainly nothing in the Constitution which would justify this contention. The States, for example, were never given the entire field of direct taxation for themselves. The steadily widening field of Federal activity and the increasing cost of defence from the first decade of the present century made any such separation of revenues impossible even at the time when the Commonwealth had only just embarked on a national programme. Customs and excise revenues would have been quite inadequate to finance the 1914-18 war and the Commonwealth, therefore, had to resort to direct taxation.¹ Total war always throws added gigantic burdens and responsibilities on a Federal Government.

These points may be made clearer by a short survey of the salient changes in the financial history of the Commonwealth. These may be grouped conveniently into four stages : (1) the period of the Braddon clause — section 87 of the Constitution — which covered the years 1901 to 1910 ; (2) the period from 1910-11 to 1926-27, the period of the *per capita* payments ; (3) the period from the Financial Agreement Act, 1928, to 1942, the period when the Commonwealth took over the debts of the six States and the Loan Council was formed ; and (4) the period of the ascendancy of the Commonwealth Government from the passing of the legislation to implement the uniform income tax plan, *i.e.* from 4th June 1942 to the present time. Each of these periods corresponds to major changes in financial policy.

(1) *Period I* (1900-1901 to 1909-10).—In regard to the first of these periods, from 1901 to 1910, monthly payments to the States of all the surplus revenue of the Commonwealth were provided for in sections 87, 89, 93 and 94 of the Constitution. Each State was credited with the Commonwealth revenue collected in that State and debited with the expenditure incurred on its behalf in the transferred departments, and also with a share of the new expenditure of the Commonwealth on a *per capita* basis. This is generally known as the “book-keeping system”. This was, under the Constitution, to continue until 1906-7 (the expiry of the first five years provided for in section 93), or until “Parliament otherwise provides”. The “book-keeping system” could thus be changed by the Commonwealth Parliament at any time after 8th October 1906, the date of the expiry of the five-year period. Payments to the States of surplus revenue of the Commonwealth ceased when the Commonwealth began to pay invalid and old-age pensions. This gave rise to criticism. In 1907-8 the Commonwealth paid its surplus revenue into a trust account as a reserve for these pensions, a procedure which was

¹ The Commonwealth Grants Commission clearly shows that it would have been impossible for the Commonwealth to vacate the field of direct taxation even if it had discontinued the *per capita* payments (*vide* table on p. 23, First Report, F. 3390, 1934).

challenged by the State of New South Wales, but upheld by the High Court. The State of Western Australia was permitted under section 95 of the Constitution to impose for five years customs duties on goods passing into that State and not originally imported from beyond the Commonwealth, such duties being collected by the Commonwealth. It may be noted that in the Constitution as it came from the final Convention in Melbourne the provision that three-fourths of the revenue from customs should go to the States was a permanent one. But free-traders believed that the raising of a customs revenue four times greater than was required by the Commonwealth Government would mean a victory for protection, and others were uncertain of the future of State revenues. Owing to these fears a compromise was made limiting the payments to the States to ten years. Section 96 was also inserted providing for special grants during these first ten years of Federation, and thereafter if Parliament thought these to be necessary.

(2) *Period II* (1910–11 to 1926–27).—In 1910 a scheme of *per capita* payments was adopted by the passing of the Surplus Revenue Act of that year, and payment became effective from 1st July. A special payment to Western Australia of £250,000 per annum in the first year, thereafter progressively decreasing by £10,000 each year, was included in this Act.¹ No constitutional amendment took place when it was passed, and thus the position of the States was insecure. A constitutional referendum was indeed taken, but it was rejected as it was thought the proposed amendment might “leg-roped the Commonwealth”. The various Governments continued, however, to honour the agreement for *per capita* payments. The Act of 1910 provided that it should continue for ten years from 1st July 1910, and thereafter until Parliament otherwise determined. *Per capita* payments continued until 1926–27.

(3) *Period III* (1927–28 to 1941–42).—The Commonwealth Government was under no obligation to continue the *per capita* payments and the Surplus Revenue Act was repealed. The States, faced with the loss of *per capita* payments, accepted certain proposals incorporated in the Finance Agreement of 1927, and hence in the Financial Agreement Act of 1928. This has improved the credit of the States as a whole.² Independent borrowing by the States increased the cost of loans, and since 1923 borrowing programmes have been considered from time to time at conferences at which the Treasurers of the Commonwealth and of the States formed themselves into an advisory but not an executive body — the Australian Loan Council. Between 1923 and 1927 it arranged for the amounts

¹ See Table 20, Part III.

² The interest contributions of the Commonwealth, however, will not increase as population increases and, therefore, the position of the States may grow less favourable as time goes on.

to be borrowed by the Commonwealth and the six States. By the Financial Agreement Act of 1928 this advisory body officially became the Australian Loan Council. It was the Central authority which arranged within prescribed limits all borrowings, conversions, renewals, redemptions and consolidations of the public debts of the Commonwealth and of the States. The Commonwealth took over the public debts of the States but left them to find the interest. The Commonwealth shared among the States an annual sum of £7,584,912, the equivalent of the *per capita* payments for 1926-27, as a contribution towards interest on these debts. It also paid for certain sinking fund contributions. The Constitution was amended (by section 105A, added in 1928) to give effect to the powers originally conferred on the Commonwealth in section 105 of the Constitution and used in the Financial Agreement of 1927. Section 105A is as follows :

- (i) The Commonwealth may make agreements with the States with respect to the public debts of the States, including :
 - (a) the taking over of such debts by the Commonwealth ;
 - (b) the management of such debts ;
 - (c) the payment of interest and the provision and management of sinking funds in respect of such debts ;
 - (d) the consolidation, renewal, conversion and redemption of such debts ;
 - (e) the indemnification of the Commonwealth by the States in respect of debts taken over by the Commonwealth ; and
 - (f) the borrowing of money by the States or by the Commonwealth, or by the Commonwealth for the States.
- (ii) The Parliament may make laws for validating any such agreement made before the commencement of this section.
- (iii) The Parliament may make laws for the carrying-out by the parties thereto of any such agreement.
- (iv) Any such agreement may be varied or rescinded by the parties thereto.
- (v) Every such agreement and any such variation thereof shall be binding upon the Commonwealth and the States parties thereto notwithstanding anything contained in this Constitution or the Constitution of the several States or in any law of the Parliament of the Commonwealth or of any State.
- (vi) The powers conferred by this section shall not be construed as being limited in any way by the provisions of section one hundred and five of this Constitution.

The period from the Financial Agreement of 1927 to 1942 separates into two well-marked divisions — that before the depression of 1930 and that from the depression to 1942. Before the depression the total deficits were not high. Indeed, in Victoria and Queensland they were low. After the depression the deficits were very abnormal in the States, at any rate until 1935-36. An examination of the surpluses and deficits of the

Commonwealth shows between 1929-30 and 1939-40 a net surplus of £6·5 millions in the Commonwealth accounts. In nine of the eleven years there were surpluses. In 1930-31 there was an abnormal deficit of £10·8 millions, but in the succeeding years there was a surplus of £18·8 millions. In the same period the net deficit of New South Wales was £43·6 millions, that of Victoria £7·8 millions, that of Queensland £8·1 millions, that of South Australia £6·5 millions, that of Western Australia £6·0 millions and that of Tasmania £0·9 million. The total net deficit for the period 1929-30 to 1939-40 was £72·8 millions for all States combined and £66·3 millions for Commonwealth and States.¹ The losses on loan works in the States rose to a very high figure. "It is obvious", said the Commonwealth Grants Commission, "that the depression has been the chief factor in increasing the deficits of the States. The depression affected the Commonwealth in a most striking way, owing chiefly to the great reduction in customs revenue. This led to an increase of Commonwealth taxation in the form of a drastic impost on property incomes, a primage duty on imports and the sales tax, which is a form of excise taxation and therefore not open to the States."² The Commonwealth was also helped very much by the suspension by the British Government of payments in respect of war debt."³

In 1933 the Commonwealth Government appointed the Commonwealth Grants Commission of three members to enquire into and report upon claims made by any State for a grant of financial assistance under section 96 of the Constitution. The grants recommended in 1937-38 were as follows: South Australia £1,200,000; Western Australia £575,000; Tasmania £575,000; making a total of £2,350,000. In 1942-43 they were £550,000, £800,000 and £575,000 respectively, making a total of £1,925,000.⁴

(4) *Period IV* (from 1942 onwards).—It is not possible to demarcate with accuracy the beginning of the fourth period which for convenience is placed as from 1942. This year has been selected as it marks the passing of the uniform income tax law by the Australian Parliament and the High Court's judgment validating it. It is, in short, a landmark in Australian constitutional and financial history.

It will be recalled that in Canada in April 1941 the Minister of Finance offered compensation to the Provincial Governments in respect of personal and corporation income taxes and the guarantee of gasoline tax revenues, if they would vacate the personal and corporation income tax fields for

¹ See Commonwealth Grants Commission, Eighth Report (F. 1357, 1941), Appendix 20, p. 125.

² In 1932-33, in the depth of the depression, Federal, State and Local Authority taxation was 20 per cent of the national income; in 1939-40 the proportion was 18·2 per cent.

³ Commonwealth Grants Commission, Third Report (F. 2251, 1936), p. 29.

⁴ See Table 20, Part III.

the duration of the war in order that a uniform tax may be levied throughout the Dominion on persons and corporations. The Provinces accepted the proposal, the Dominion-Provincial Taxation Agreement Act was passed, and in the Budget for 1942-43 \$84,428,000 were provided for compensation. An effective and equitable tax policy during the war was thus made possible. In Australia the highest amount of taxation was imperative to finance the war, but the Commonwealth Government was severely handicapped in getting a reasonable return from the taxation of income by the high rates of income tax prevailing in some States. In January 1941 the Commonwealth Government submitted to the States alternative proposals for the reduction of all State income tax to the level of the most lightly taxed State or an increase to the level of the most heavily taxed. In the former case the States were to be compensated for their sacrifice of revenue by Commonwealth grants, and in the latter case the increased taxation was to be lent to the Commonwealth. The States rejected these proposals. On 27th June 1941, at a meeting of the Loan Council, the Commonwealth put forward a fresh proposal that the States should vacate the income tax field for the duration of the war in favour of the Commonwealth, and accept £30 millions annually in compensation, of which £24·5 millions would be distributed on a basis of £3 : 10s. per head of the population, the balance to be divided on any basis to which the States could agree. The Treasurer (Mr. A. W. Fadden) said that the Commonwealth must make the maximum demand on the taxpayer (who is the same taxpayer both in regard to Commonwealth and State taxation), and that the claims of the Commonwealth must come first. Otherwise, the varying incidence of State taxation may have to be overlooked by raising the Commonwealth taxation on high incomes (which were already heavily taxed in some States), or by abolishing the allowances on State income tax, such as the deduction which is allowed for Commonwealth tax purposes, and also many other concessions enjoyed by taxpayers. Either course would affect the State differentially. Thus Victoria, with an income tax of £2 : 11 : 4 per head of population, would not be affected to the same degree as Queensland, where the rate was £5 : 12 : 2 per head, or as New South Wales, where it was £5 : 10 : 7. The alternative course might be acceptable to Queensland but Victoria might regard it as unfair. With the exception of the Premier of South Australia all the State premiers opposed the proposals of the Commonwealth Government as imposing unconstitutional and crippling burdens. The Premier of Victoria protested that his State would be penalised for its long record of prudent finance to relieve the improvident States. If the State vacated the income tax field there would be a huge increase in Commonwealth taxation on low and medium-sized incomes in Victoria to bring the total taxation to that

payable by Queensland and New South Wales. The Premiers of Queensland and Western Australia, on the other hand, held that the lower rates in Victoria have been made possible, not by better financial methods, but by the high protection policy of the Commonwealth. This, in their view, has made it easier to maintain a balanced Budget in the highly industrialised States than in those dependent almost entirely on primary production and disastrously sensitive to world price fluctuations.

War finance exigencies continued to force the issue of financial readjustments for the duration of the war, in spite of the States' cry that State sovereignty was endangered by what was called "unification by finance". A Committee, appointed to consider a scheme of uniform income taxation for the Commonwealth, consisting of Professor R. C. Mills, of the University of Sydney, Mr. Scullin and Mr. Spooner, presented a report early in April 1942. They recommended the retirement of the States from the field of income taxation for the duration of the war and one year thereafter, the substitution of the Commonwealth as the one income-taxing authority as from 1st July, and compensation to the States for loss of revenue. On 22nd April the Premiers' Conference representing the Governments of all the States and of the Commonwealth rejected by a decisive majority the Commonwealth Government's proposal. This was done although the Commonwealth Prime Minister had clearly stated that the Commonwealth must have complete freedom of action over the whole field of income tax throughout the war, with the right to take all additional proceeds of the increasing national income or the increased rates of taxation, and the States should limit their share of income taxation to £34·5 millions annually during the war. Three weeks later the Commonwealth Treasurer (Mr. Chifley) introduced into the House of Representatives three bills for a uniform tax throughout Australia — one bill provided for the temporary transfer to the Commonwealth of the trained staffs, accommodation and equipment of the States used for the collection of income tax, a second bill provided the payment for that assistance and for income tax to be equalised throughout the Commonwealth according to ability to pay, and a third bill provided that the payment of Federal income tax should have priority over the States income tax during the war and for one year thereafter. The Commonwealth estimated an additional yield of from £12 millions to £15 millions for war purposes. The States were to receive grants based on their average income tax collections for the last two years. The bills passed both Houses — the House of Representatives on 29th May and the Senate on 4th June. The new measures were to come into force on 1st August. The Governments of Victoria, Queensland, South Australia and Western Australia applied to the High Court for a decree invalidating the Acts as *ultra vires* under

the Commonwealth Constitution. The case was heard before a full Bench of the High Court on 22nd June, and on 23rd July the Commonwealth Acts were held, in a majority judgment, to be valid in their entirety. It was held that these Acts were a genuine exercise of Parliament's defence power. It was essential for the effective prosecution of the war, which was being carried on to preserve the very existence of the Commonwealth and the States, that the entire resources of the country should be marshalled in the war effort. The Commonwealth, therefore, must have command of the sinews of war, of which income tax was a very important one. On 11th August at a Premiers' Conference the Commonwealth Prime Minister (Mr. Curtin) announced that the Commonwealth proposed to levy an entertainments tax which hitherto had been a State source of revenue, and he assured the premiers that the Commonwealth did not propose any further encroachment. This was regarded by the States as another inroad on the States' taxation field. Mr. Curtin said that the Commonwealth would levy a uniform tax yielding £3 millions a year as against £0·75 million raised by five States, Queensland at present not imposing an entertainments tax. The Commonwealth would refund to the States what they received from the tax in the current financial year. The Treasurer of Queensland said that his Government proposed to introduce an entertainments tax because of the imposition by the Commonwealth of a uniform income tax. All the State premiers, with the exception of Tasmania (who accepted the proposal for the war only), opposed the Commonwealth's scheme. Mr. Curtin informed the Conference that the Treasurer would submit the proposal to each State separately, and, if the States did not agree, the Commonwealth would impose on the States' entertainments taxes a uniform Federal tax. It should be noted that the Commonwealth levied an entertainments tax from 1916-17 to 1932-33. Mr. Curtin said the proposed tax was a luxury tax enforcing the required approach to austerity. [Finally all the States agreed to withdraw from the entertainments tax field and were compensated on the basis of the previous year's revenue from this source. The new Commonwealth tax was a steeply graduated one rising to as much as 5s. 10d. on 12s. 6d., which is the cost of admittance to race meetings.

It is now possible to summarise the financial scheme of the Constitution :

(1) The Commonwealth has the widest powers of taxation under the Constitution, Federal taxation taking priority over State taxation. It has exclusive power to impose customs and excise duties, including sales taxes, a form of excise taxation. Its main source of revenue is customs and excise, and since the outbreak of war income and sales taxation has been extended. Other sources of revenue are estate duties, the land tax and,

in 1942, the entertainments tax to which it was decided to revert, reclassified as a direct tax. From 1916-17 to 1932-33 the Commonwealth had levied an entertainments tax, and from 1930-31 onwards a sales tax. In 1937-38 Commonwealth taxation was £69·0 millions. Indirect taxes yielded £56·4 millions (£8 : 4 : 4 per head of population) and direct taxes £12·6 millions (£1 : 16 : 10 per head of population) — a total of £10 : 1 : 2 per head of population.

(2) Except in regard to customs and excise including sales taxation, both the Commonwealth and the States have full powers of taxation. The main sources of State taxation are the income tax (including the dividend tax and other taxes on income), probate and succession duties, other stamp duties, the land tax, lotteries (in Queensland and Tasmania), the taxation of racing, motor vehicles, liquor and entertainments, and licences.

Taxation by the States in 1937-38 amounted to £49·7 millions, or £7 : 5 : 2 per head of population, of which £35·9 millions was direct and £13·8 millions indirect.

(3) The Commonwealth makes very considerable payments from revenue to the States in connexion with States' debts, grants for Federal Aid roads and works, special grants, grants for local public works, medical research and other items. In addition, assistance is given for relief of primary producers in the form of assistance to the wheat and other industries and of bounties. Primary producers also receive payments from the loan fund. Payments from revenue made direct to the States and excluding assistance for the relief of primary producers in 1937-1938 amounted to £16·1 millions. Of this, £9·9 millions, or 11·5 per cent of the revenue of the States in that year, enters into the Consolidated Revenue and similar accounts included in Tables VI and VII on pp. 128-9 and 130-31.¹

(4) Special grants under section 96 of the Constitution are made to three of the six States — to Western Australia since 1910-11, to Tasmania since 1912-13 and to South Australia since 1929-30. The fundamental principle, laid down by the Commonwealth Grants Commission and quoted above, is that such grants are necessary when a State is unable to perform efficiently its functions as a unit of the Federation, and the grant is determined by the amount required to make it function, with reasonable effort, on a standard not appreciably below that of other States. The aim is to produce Budget equilibrium without impairing State responsibility. This necessitates the measurement of relative financial position, which entails Budget corrections on account of variations in accounting practice, and adjustments on account of economy in expenditure, severity of taxation,

¹ See also Tables 3, 4, 18 and 19 in Part III.

and maintenance of capital equipment. Such grants are required in a Federal system mainly for three reasons. In the first place, it is impossible to relate finance to function, and there is consequently maladjustment between the Centre and the units in the distribution of constitutional powers. Secondly, in a Federation there is always specialisation, which increases the differences between the units and benefits some more than others. It may even benefit the Centre at the expense of the units if their specialisation is due to tariff protection; the Eastern States of the Commonwealth are a good example. These are permanent factors. A less permanent factor is that the weaker States in a time of depression are an embarrassment to the Federation unless they are assisted. This is especially so where the loan policy of the States has been unwise, as in the case of some States of the Commonwealth. The 1942 Acts of the Commonwealth Parliament on uniform income tax throughout the Commonwealth, with the High Court's judgment upholding these Acts, show the overriding power of the Australian Parliament in taxation. During the forty years of Australian Federation the Commonwealth has greatly increased its governmental functions, and this has required the raising of greater revenues. This tendency has been very much accelerated by the war, as it was, though to a lesser extent, by the war of 1914-18. Total war adds enormously to the burdens and responsibilities of the Federal Government. The judgment of the High Court makes it clear that the Commonwealth's power to pass legislation virtually depriving the States of their taxation powers does not depend on the existence of a state of war in which the Commonwealth may exercise unlimited emergency powers. The Rt. Hon. William Hughes, K.C., holds that the judgment is the "final answer to the States' pretensions to sovereign powers", and the Rt. Hon. R. G. Menzies, K.C., a former Attorney-General of the Commonwealth Government, believes the judgment to be the beginning of a new era in which the Federation of Australia must be regarded as much more a unitary form of government and much less a Federal system than it was thought to be. In this respect, therefore, it is becoming similar to that of the Union of South Africa, and should a change in the Constitution take place after the war it is not unlikely that this will be on the South African model. Forty years' working of the Constitution shows that it requires revision, and public opinion, when it thinks about the matter at all, increasingly thinks of Australia as a whole. The questions of investing the Australian Parliament with greater functions, of the division of the States into many more Provinces with modest Provincial Councils, and of the increase in the membership of Parliament, are outside the scope of this Report. These points, however, have gained new importance in view of recent happenings in the financial relations of the

Commonwealth and the States. [Without sound finance, sound government is not possible, and without sound government, sound finance is also impossible.]

The trend towards increased importance of the Commonwealth in the constitutional framework has been strikingly demonstrated by the recent provisions for post-war reconstruction. On 22nd September 1942 Mr. Curtin, the Commonwealth Prime Minister, announced that the Cabinet had decided to initiate legislation authorising a referendum on the Federal Constitution. It was intended to give the Commonwealth wide powers in the economic and social field, with the object of enabling it to take effective action for reconstruction after its war-time powers had lapsed. A Convention, made up of representatives of the Governments and Oppositions of the Commonwealth and of the six States, was called to consider the proposals. As was to be expected, objections were raised on the part of the States, which complained that the measures were unificationist, and on that of the Opposition, which complained that the Commonwealth Government were using the war as a pretext for carrying out the Labour policy. But in the end unanimous agreement was suddenly reached. On 2nd December it was announced that the Convention had accepted the re-drafted bill, and that the State premiers had agreed to introduce it in their Parliaments before the end of January and to do everything in their power to secure its passage. It was hoped that this would obviate the necessity for a referendum, which would have been undesirable in war-time. The bill provided for the transfer by the States to the Commonwealth of specified powers for a period of five years after the cessation of hostilities. It would enable the Commonwealth to make laws for the purpose of post-war reconstruction on the following subjects: the conditions of Service men and the dependants of those who are killed or disabled; employment and unemployment; the organised marketing of commodities; the codifying of company law and the law regulating trusts, combines and monopolies; profiteering and prices (exclusive of prices or rates charged by the State or semi-governmental or local governing authorities for goods and services); production (other than primary) and the distribution of goods with the consent of the State Executive Council; primary production (provided that no legislation under this paragraph shall discriminate between the States); control of oversea exchange; oversea investments and the regulation of the raising of money in accordance with such plans as the Australian Loan Council approves; air transport; the uniformity of railway gauges; national works (provided that the consent of the State Executive Council shall be obtained before each work is undertaken and that it is carried out in co-operation with the State); national health in co-operation with the State; family allowances;

and aborigines. The bill was passed by all the State Parliaments, with two exceptions. The Victorian Parliament inserted a clause making its operation dependent on its being passed in all the other States, and the Tasmanian Legislative Council (or Upper House) rejected it altogether. It is to be re-submitted to them, and if it is rejected again, there may have to be a referendum.

It is evident that the exercise of these powers would involve far-reaching co-operation between the Commonwealth and State administrative machineries. It is even more evident that the transfer to the Commonwealth of all these functions, and the comprehensive reconstruction policy which they are designed to make possible, would be bound to have most important repercussion on the financial relations between the Federation and the units.

III. GOVERNMENT REVENUES AND EXPENDITURES

General Trends

The increased cost of government in Australia in recent years is brought out in the table on the opposite page.

The expenditure figures include expenditures from revenue, including gross expenditure of business undertakings, of the Commonwealth and the States, less duplication due to grants and other intergovernmental payments. The revenue figures include tax revenues paid into the Consolidated Revenue or corresponding funds and gross revenues from business undertakings, less duplication as in the case of expenditures. Comparable figures of Local Authority expenditures and revenues are not available for any of the years given except 1937-38. For that year they have been shown in the footnote to the table.

The trends exhibited by the figures are clearly marked, and are very similar to those prevailing in the other Federations studied in this Enquiry. Both in the case of the Commonwealth and in that of the States there was a very considerable rise in expenditures and revenues during the war of 1914-18. After the first adjustments to a peace-time economy had been made, there was a further rise, more gradual but unmistakable, until the depression of 1930. This for a time caused a fall in the revenues and expenditures of both Commonwealth and States, though State expenditures did not fall until 1932-33. After the depression the tendency to rise reasserted itself, being reinforced after a few years by the period of rearmament. With the outbreak of war Commonwealth revenues and expenditures both increased enormously, whereas the rise was much less marked in the case of the States. With the exception of the depression years, Commonwealth expenditures, and consequently revenues, have in

the long run tended to increase more than those of the States and Local Authorities.

These tendencies are further illustrated by the table on p. 124, which compares Government revenues and expenditures, and defence expenditures separately, with the national income. It shows that the Commonwealth finances were more sensitive in the short run to changes in the national income during the depression than were those of the States. Moreover, with respect to her war effort Australia did not get fully into her stride until after the period covered by the figures given there.

The Tax Structure

It will have been noticed that in the above tables the Commonwealth appears to be shown to have continuous large surpluses, and the States deficits usually of similar magnitude. This is due to the transfer to the States of revenues collected by the Commonwealth, which has been dealt with in more detail in section II of this chapter ("The Constitutional Background"). The following table and diagrams illustrate the transfer of revenues since the last war (the figures refer to tax revenues only):¹

TABLE V
TAX REVENUES AVAILABLE TO COMMONWEALTH AND STATES

¹ Since 1931-32 the Commonwealth has also made payments to the States from Loan Fund. Table 18 in Part III gives in summary form Commonwealth payments to or for the States from revenue and from Loan Fund from 1930-31 to 1941-42, Table 19 gives details of the payments made in 1937-38, while Table 20 gives special grants from 1910-11 to 1942-43.

CHART I
TAX REVENUES COLLECTED BY AND AVAILABLE TO COMMONWEALTH
AND STATES

CHART II
PROPORTION OF TOTAL TAX REVENUES AVAILABLE TO COMMONWEALTH
AND STATES

Note.—The proportion of total tax revenues collected by the Commonwealth but made available to the States in the form of grants and similar payments was as follows :

	Year ended 30th June—							
	1920	1925	1930	1935	1938	1939	1940	1941
Grants, etc., as a percentage of total tax revenues .	12	11	12	14	13	13	11	8

The figures, and especially the percentages in Chart II, show that during the twenties and thirties of the present century, up to the rearmament period, the tendency for Commonwealth revenues to rise relative to those of the States was for a time reversed, at any rate in the case of tax revenues. This phase was specially marked during the depression when the receipts from indirect taxation, on which the Commonwealth largely relied, fell considerably, while those from direct taxation, the main source of revenue of the States, increased ¹ (see pp. 109-10 above). It came to an abrupt end with the advent of rearmament and war, and the expansion of Commonwealth revenues again outstripped that of State revenues, as the Commonwealth came to rely more and more on direct taxation (see pp. 115-22 above, and compare Table VII below with Table 1 in Part III).

Tables VI and VII give the main heads of revenue of Commonwealth, States and Local Authorities in 1937-38 in thousands of pounds and in percentages. The items are divided into the four main groups: I, Progressive Taxes; II, Taxes on Real Property; III, Taxes on Business; and IV, Mainly Consumption Taxes. The figures are, in the main, taken from those published by the Commonwealth Bureau of Census and Statistics in their bulletin *Finance*. These refer to the Consolidated Revenue Accounts of the Commonwealth and the States, except that in the case of New South Wales several special funds are included because they cover fields included in other States in the Consolidated Revenue Fund. The other main funds, the Loan and Trust Funds, are excluded from the tables.²

The figures differ, however, from those in *Finance* in several respects. To begin with, net revenues only of business undertakings have been included, as these alone are comparable to taxes. Net losses incurred by some States or by the Commonwealth have not been deducted from net revenues of others in arriving at the totals, but have been included in the

¹ Commonwealth revenue from customs and excise amounted to £41·8 millions in 1929-30, £28·3 millions in 1930-31, £28·4 millions in 1931-32, £48·4 millions in 1937-38, £53·8 millions in 1940-41, and was budgeted to be £47·6 millions in 1941-42, though it turned out to be £56·8 millions. In 1937-38 it accounted for 70 per cent of Commonwealth tax revenues, whereas income taxes accounted for 60 per cent of State tax revenues.

² The Commonwealth Loan Fund came into existence in 1911-12. In the last war it was divided into a General Loan Fund, mainly for public works, and a War Loan Fund for war purposes. The State Loan Funds are debited with all loan moneys raised by the States and credited with the expenditure therefrom on public works or other purposes. Payments into the Trust Fund of the Commonwealth include those for invalid and old-age pensions under the Commonwealth Invalid and Old-Age Pensions Act, 1908. State Trust Funds include the amounts held in trust by the State Governments for various purposes, e.g. savings bank funds, municipal sinking funds placed in the hands of the Governments, the sums deposited with the Governments by life insurance companies in cash or approved securities as required by law, and various other accounts such as suspense and superannuation accounts.

NET TOTAL	65,152	79,847	24,723	169,722

¹ These figures differ from those in "Finance" (bulletin of the Commonwealth Bureau of Census and Statistics) in that they include net revenue only of Commonwealth and State business undertakings. For other details, especially on State taxation figures, see text.

² Complete separate data are not available for individual and company income taxation. The (known) total of Commonwealth income taxation has therefore been split up in the proportion of assessments for the year in question, and that of State income taxation has been given in Group I without being split up. The figure for State individual income taxation thus includes company taxation.

³ Separate figures of rates and penalties are not available for Queensland and South Australia. In the other States penalties are very small in proportion to rates (see Part III, Table 7).

⁴ State liquor taxes are given under "Other Similar Taxes and Licences".

⁵ Net revenues only for business undertakings. Total receipts for local public works and services.

⁶ Excluding railways

⁷ Commonwealth and States.

⁸ Excluding balance of interest on States' debts payable by States.

expenditure tables (Tables XI and XII) on pp. 139-40 and 141-2. Secondly, only a certain proportion of total State tax collections¹ is included in the Consolidated Revenue accounts as given in the above-mentioned bulletin, the remainder being paid to various special funds differing in nature

¹ Total revenues from taxation of all Governments in 1937-38 by States are given in Tables VIII and IX below.

and extent as between different States. It was necessary to use the figures from *Finance* in order to obtain comparable totals. On the other hand, the actual proportion of State tax revenues derived from various sources had to be given in order to present a fair and comparable picture of the revenue system. For this reason the figures of State tax collections from different sources have been reduced proportionately so as to add up to the amount actually paid to Consolidated Revenue. This accounts for the differences between the figures in Table VI and those in Table VIII below.

A caveat should be noted, especially in making comparisons with other chapters of this Enquiry. It has not been possible to obtain separate figures of individual and company income taxation for all the States, and for this reason the whole of State income tax collections has had to be given under Group I (Progressive Taxes, item "taxes on individual income"). This means that the totals of Group I for State revenues and for all Governments are above the true figure, while the corresponding totals of Group III are below it.

The Australian revenue system, as shown in these tables, has three important characteristics. The first of these is its "regressivity" or high degree of regression. Group IV (Mainly Consumption Taxes) comprises no less than 63 per cent of total revenues, of which 19 per cent represents customs, 9 per cent excise, 10 per cent other similar taxes and licences, 15 per cent revenue from business undertakings, public works and services, and 10 per cent miscellaneous items (including interest receipts). Progressive taxes accounted for 21 per cent, of which 18 per cent represented taxation of individual income and the remaining 3 per cent probate, estate and succession duties. (But it must be remembered that anything between one-quarter and one-half of the income tax figure may be represented by State company income taxation.) Group III (Taxes on Business), other than State company income taxation, represented 4 per cent, mainly Commonwealth tax on company income and State stamp duties. Groups I and III together accounted for 25 per cent of the total revenues of all Governments combined. Group II (Taxation of Real Property) accounted for 12 per cent, chiefly local rates.

The regression of the system is most conspicuous in the case of Commonwealth revenues. This brings us to the second important characteristic. In contrast to other Federations studied in this Enquiry (except Canada), the States, or units, and not the Federation, are the progressive element in the revenue system. This is due to historical causes which have been alluded to in section II of this chapter. In the United States the predominance of the Federal Government in financial matters was well established by the time that progressive taxation began

to be developed, but this was not the case to anything like the same extent in Australia. Hence the Commonwealth still relied, in 1937-38, on customs for no less than 44 per cent of its revenue, on excise for 20 per cent and on the sales tax for 11 per cent. Business Undertakings (the Post Office) and miscellaneous items each accounted for another 4 per cent, making a total for Group IV of no less than 83 per cent. (This is higher than in any other of the Federations studied here, with the exception of India (87 per cent), where the heavy reliance of the Provinces on property taxation makes their revenue system even more regressive than that of the Centre.) Group II (Taxes on Real Property) accounted for 2 per cent; Group I (Progressive Taxes), mainly individual income tax, for 10 per cent, and Group III (Taxes on Business), represented by company income tax, for the remaining 5 per cent.

The picture is very different in the case of State revenues. Taxes on income represent 28 per cent of the total, probate and succession duties 5 per cent (making a total for Group I of 33 per cent), taxes on business other than company income tax 3 per cent, making a total for Groups I and III of 36 per cent as compared with 15 per cent in the case of Commonwealth revenues. Group II (Taxes on Real Property) represents 7 per cent of State revenues, most of which is strictly not taxation but non-tax revenue from lands. Group IV (Mainly Consumption Taxes) represents 46 per cent, of which various consumption taxes and licences account for 10 per cent, business undertakings (especially railways) for 20 per cent, and miscellaneous items (including interest) for 16 per cent. Grants and similar payments from the Commonwealth account for the remaining 11 per cent, although it must be noted that not all Commonwealth payments to or for the States, even from revenue, are included in this figure.

Local Government revenues exhibit the usual feature of reliance on property taxation, mainly in the form of rates (Group II comprises 54 per cent of the total). Licences, the only item in Group III, account for only 1 per cent, business undertakings for little more, but revenues from various works and services and from local council properties swell the sub-total "Business Undertakings, Public Works and Services" to 16 per cent, making, together with 3 per cent of miscellaneous revenues, a total of 19 per cent for Group IV. Grants from the higher layers of Government comprise 26 per cent of the total.

All this brings us to the last of the three outstanding characteristics, namely, the comparative unimportance of Local Authorities in the revenue system. They account for only 15 per cent of the net total of Government revenues, as compared with 47 per cent in the case of the States, and 38 per cent in that of the Commonwealth. This is largely due to the fact that Australia is a new country, largely developed with the help of State aid,

whereas Local Authorities only gradually came into being.

This last fact accounts for a feature which is not brought out by the above tables, but must be discussed here — the differences between States, both in regard to tax structure and in regard to the distribution of functions between the State and Local Governments and other authorities. Some of these differences are brought out by Tables VIII and IX, which give the revenues of all Governments from taxation in 1937–38, by States, in thousands of pounds and in percentages.¹

It is evident from these tables that there are considerable differences between the States with regard to the progression of their tax systems, and with regard to the proportion which Local Government taxation bears to State taxation. When comparisons are made between the revenue, expenditure and debt of States it is necessary to remember that the functions of State Governments differ, some performing municipal or semi-municipal functions. The States render many public services which in Great Britain are left either to municipal or private enterprise. Gross receipts from business undertakings represent a very considerable proportion of State revenues as given in the official accounts, although in our tables, for reasons already explained, net revenues only have been included.

Transport is a case in point. In New South Wales and Western Australia tramways are controlled by the State Government, whereas in other States they are run by boards or trusts or private companies. In Tasmania transport has been vested in a Transport Commission since 1st July 1939. Financial responsibility for roads varies between the State and Local Government authorities. The cost of State highways² is borne by the State in New South Wales, Victoria and Tasmania, while in Queensland Local Authorities are responsible for a proportion not exceeding 50 per cent of maintenance cost. Main roads in Western Australia and Tasmania are maintained by the State, whereas in New South Wales and Victoria Local Authorities are responsible for one-quarter and one-third respectively and in Queensland for not more than 20 per cent. In South Australia the contribution of Local Authorities is only a small proportion of the total expenditure on main roads. For water supply and sewerage there is a considerable divergence in financial responsibility. In New South Wales and Victoria, for example, it is divided between State, Local and semi-Governmental authorities such as boards or trusts. In Queensland and Tasmania Local Authorities carry the burden. In South Australia responsibility rests with the State Government, while in Western Australia

¹ See also Tables 3 to 10 in Part III.

² Roads for which the States bear the whole or part of the financial responsibility are divided into several classes, of which State highways are the first and main roads another.

it is divided between the State and Local Authorities. For this reason payments for water supply and sewerage have been excluded from the following table (taken from the Seventh Report of the Commonwealth Grants Commission (F.3600), 1940, p. 74). The other differences between the figures in it and those in Table VIII above are due to the exclusion from the latter of charges for public utility services. (The figures in Table VIII are taken from *Finance*, the bulletin of the Commonwealth Bureau of Census and Statistics.)

TABLE X

LOCAL GOVERNMENT TAXATION, 1937-38
(Excluding payments for water supply and sewerage)

State	Total	Per Head of Population
	£ thousands	s d.
New South Wales . .	6,070	44·11
Victoria . .	3,960	42·6
Queensland . .	2,681	53·11
South Australia . .	915	31·6
Western Australia . .	764	33·5
Tasmania . .	357	30·4
Total .	14,747	43·2

There is a fair equality of service for items included under Local Government activity, but the debt charges in the last three States in the above table are very much less than in the first three. There is evidence that one of the chief causes for the low level of Local taxation in the last three States in the table is that the Governments of South Australia, Western Australia and Tasmania raise loans for local purposes which in the first three States devolve upon Local Authorities. In other words, the States of South Australia, Western Australia and Tasmania shoulder burdens which, being for Local purposes, should fall on Local Authorities.

We have already seen that Local Government financial statistics in Australia are not very satisfactory. This makes it difficult at times to make accurate comparisons, either between States or especially between years. But the matter is complicated by the fact that functions are not equally distributed in the several States, and for some purposes it would perhaps be best to add State and Local figures when making comparisons between States. Moreover, as we have already seen in connexion with the State taxes included in Tables VI and VII above, difficulties are caused by the fact that various States have special funds apart from the Consolidated Revenue Fund, and that the fields covered by these funds (and the

corresponding statistical figures) are not the same as between different States, nor as between different periods in the same State.

Public Expenditures

Tables XI and XII below give public expenditures from revenue of all Governments in 1937-38, in thousands of pounds and in percentages. The figures, like those in Table VI above, are taken for the most part from *Finance*, the bulletin of the Commonwealth Bureau of Census and Statistics. They refer, in the case of the Commonwealth and the States, to expenditures from the Consolidated Revenue Fund,¹ although in the case of New South Wales several special accounts have been included to make the data comparable with those of the other States. But there are certain differences between our figures and those in *Finance*. In the first place, they have been arranged in the usual groups: 1, Primary Functions; 2, Secondary Functions — (1) Social Services, (2) Developmental Expenditure, (3) Miscellaneous; and grants and similar intergovernmental payments. Secondly, net expenditure only on Commonwealth and State business undertakings has been included. (*Finance* gives net profits only of Local Government undertakings, just as we do.) For this purpose, net losses incurred by the various authorities have been given, and any net profits made by other authorities have not been deducted but given in the revenue tables (Tables VI and VII above). Thirdly, Commonwealth expenditure from excess receipts (*i.e.* from surplus revenue of the previous financial year) has been included. Lastly, Commonwealth expenditure on pensions and debt services has been eliminated from the *Finance* figures of the cost of the various departments other than business undertakings and Territories, and given separately. It should be noted that no separate details of expenditure on pensions by Local Authorities are available, and that, in contrast to other chapters of this volume (except Chapter VI on South Africa), figures for debt services include not only interest payments but sinking fund payments, redemption and conversion expenses, and exchange. It has not been possible to eliminate grants to Local Governments from State expenditure figures. This is why the totals of primary and secondary functions in the last column of Table XII add up to 104 per cent (of the net total for all Governments).

✓ The most outstanding feature of these tables is the enormous proportion of expenditure, especially State expenditure, which is devoted to debt services. It must be remembered that the figures are appreciably swollen by the inclusion of items which, as indicated above, have been omitted in most of the other chapters. Nevertheless, the contrast with the other Federations studied here is too great to be explained away by this. An

¹ Hence loan expenditure of all kinds is, of course, excluded.

NET TOTAL	61,000	79,868	24,962	165,830

¹ These figures differ from those in "Finance" (bulletin of the Commonwealth Bureau of Census and Statistics) in that they include net expenditure only on Commonwealth and State business undertakings, and that Commonwealth expenditures include expenditure from excess receipts. For other details see text.

² Includes police, penal establishments, Local Authority grants to fire brigades, and other items.

³ Includes £104,758 of miscellaneous expenditure on account of the war of 1914-18.

⁴ Excludes business undertakings and Territories. No separate details are available for Local Authorities.

⁵ Interest, sinking fund, redemption and conversion expenses, and exchange. Business undertakings and Territories are excluded. The Commonwealth figure includes £276,558 of expenditure from excess receipts in reduction of deficits.

⁶ Soldiers' children education scheme [war (1914-18) services expenditure] and National Library.

⁷ Health administration, sanitary and garbage services, hospitals and ambulances, and other charities.

⁸ Expenditure on Post Office works out of Excess Receipts

⁹ Commonwealth: payments to States for Federal Aid roads. The total for all Governments probably includes duplication amounting to about £2 millions due to grants to Local Authorities. It has not been possible to eliminate this, since no details are available for Western Australia and since neither Commonwealth payments for Federal Aid roads nor road expenditure or grants to Local Authorities appear in the State Consolidated Revenue Fund accounts as given in *Finance*.

¹⁰ Includes scientific research included under "Education" in the State figures and in other chapters of this Enquiry.

¹¹ New works £3,551,776, and miscellaneous £113,318.

¹² State grants to Local Authorities are not given separately in *Finance*.

¹³ Of this, £5,691,747 was for unemployment relief and roads (divided in a ratio of about 3 : 2). See also footnote 9. It is probable that some of these grants should be subtracted from Commonwealth rather than from State expenditures in arriving at the net totals.

examination of Table 6 in Part III, which gives the percentage distribution of the expenditure from revenue of the individual States in 1937-38, shows that the different States vary considerably with regard to the proportion of their expenditure devoted to debt services. It is highest in the case of Western Australia, South Australia and Queensland. One reason is deficit financing such as occurred during the great depression — we have already noticed that although State revenues declined at that time, expenditures only followed the downward course of Commonwealth expenditures after some delay. But there are more important reasons, connected with the fact that in Australia the States perform functions elsewhere entrusted to Local Government authorities or left to private enterprise. The State debts, therefore, have increased markedly with the

Note—For footnotes see Table XI. In the above table, aggregate expenditures of all Governments (last column, primary and secondary functions) add up to 104 per cent (of the net total). The reason for this is that it has not been possible to eliminate grants to Local Authorities (4 per cent of the net total) from the expenditures of the higher layers of Government.

gradual development of Australia. Yet there is more to it than that. The Commonwealth Grants Commission has on several occasions in its annual reports commented unfavourably on the heavy unproductive debt of the States, especially of the three States claiming special grants from the Commonwealth—South Australia, Western Australia and Tasmania. The Commission also believed that “there is strong evidence . . . that the claimant States do not compel the local authorities to bear their burden of loans for local purposes in the same way as the non-claimant States”.¹ “The proportion of unproductive loan expenditure in Western Australia and Tasmania is such that it should be a matter of considerable concern. . . . No adequate provision, either by way of amortisation of debt or by charges for services, has been made to relieve the losses appearing in the State budget.”² The Commission also showed in what way past policy had been extravagant or mistaken. For instance, loan expenditure is not always made on a plan by which all loan charges are met by charging the cost to the beneficiaries, or by which the loan is liquidated by depreciation and sinking fund charges.

¹ Commonwealth Grants Commission, Fourth Report, p. 59. Cf. also Fifth Report, pp. 59-65.

² Commonwealth Grants Commission, Eighth Report (1941), pp. 72 and 73. See also Table 15 in Part III.

Another feature of the tables is the comparatively high proportion of Commonwealth expenditure devoted to secondary functions. In this respect Australia resembles the United States more than the other Federations studied here, although the expenditure in question is concentrated on a fairly narrow field. Apart from payments to States with respect to Federal Aid roads, the only important item of Commonwealth expenditure on secondary functions was invalid and old-age pensions. Education is mainly a matter for the States, and so are poor and unemployment reliefs. Responsibility for public health and similar items is divided between the States and Local Authorities. The Commonwealth spent £400,000 on maternity allowances in 1937-38. The State of New South Wales spent £1,470,000 on family endowment. Since July 1941 there has been a more comprehensive Commonwealth system of family endowment, covering all States. The scheme provides for a payment of 5s. a week in respect of all children under 16 years of age, irrespective of the amount of family income. In the Commonwealth Budget for 1941-42 £13 millions were provided for this purpose. This provision promised temporarily to reverse the war-time trend of Commonwealth expenditure from revenue on primary functions to increase in proportion to expenditure on secondary functions (see Table 2 in Part III). As we have seen (p. 121), family allowances are among the subjects over which the Commonwealth is to be given power under the recent agreement with respect to post-war reconstruction. In general, the terms of this agreement mean that after the war there will be a further tendency for the Commonwealth to spend a greater proportion of its revenue on secondary functions.¹

The tables also illustrate the transfer of revenue from the Commonwealth to the States by means of grants and other payments, although not all of these are included in the item "Grants and similar intergovernmental payments". For instance, payments for Federal Aid roads have been given under road expenditure. Unfortunately the figures in *Finance* do not include the State road funds; neither do they show separately grants by the higher layers of Government, such as the States, to Local Authorities. For this reason the figure for total road expenditure in the tables probably includes a certain amount of duplication in respect of Local expenditure from grants, while it does not include State expenditure not financed from Commonwealth grants. Commonwealth payments to or for

¹ This has been further borne out by the social security plans now being introduced. The first stage, announced by the Commonwealth Treasurer on 11th Feb. 1943, is the creation of a national welfare fund. This is to be financed from an annual contribution from Commonwealth revenues amounting to £30 millions, or one-quarter of the receipts from individual income tax, whichever is the lower. The benefits to be paid from the fund include higher maternity allowances, funeral benefit for old-age pensioners, and allowances for dependent wives and all unendowed children.

the States in 1937-38, from revenue and from loan fund, are given in detail in Table 19 in Part III.

IV. PUBLIC DEBT

On 30th June 1938 the public debt of all Governments in Australia was as given in Table XIII, pp. 145-46.

Debt maturing in Australia is given in Australian pounds in the official accounts; debt maturing in London in pounds sterling; debt maturing in New York in pounds into which the dollar figures have been arbitrarily converted at the rate of £ = \$4.8665; debt maturing in New Zealand in pounds; and total debt represents the total "face" or "book" value of the debt, *i.e.* no account has been taken of the differences in the various pounds in adding up debt maturing in different centres.

Since the Commonwealth took over the debts of the States under the Financial Agreement Act, 1928, the public debt of Australia as given in the Commonwealth Budget Accounts comprises both debt for Commonwealth purposes and debt on account of the States. The corresponding figures for 1941 have been given in Table 11, Part III (Commonwealth and State Debt, 30th June 1941). Owing to the differences between States with respect to the functions of State, Local and semi-Governmental authorities, the debt of the latter has been included in Table XIII below.

The Commonwealth debt is much more recent than the State debt. New South Wales, for example, began borrowing in 1842. The Commonwealth Government first entered the loan market as a borrower in 1915, although previous to that, in 1911, it had taken over transferred properties, and the liabilities of the Northern Territory and of the Port Augusta-Oodnadatta Railway amounting to £5.9 millions. Some property (buildings, etc.) was taken over from the States at the time of Federation, and the Commonwealth paid 3½ per cent on the value of the property so transferred. Other debt was incurred for works and various purposes, but it is war that has been mainly responsible for the growth of the Commonwealth debt. Debt on account of the war of 1914-18 represented more than two-thirds of the total debt for Commonwealth purposes on 30th June 1938. By 30th June 1941 the present war had swollen the proportion of Commonwealth debt due to war to three-quarters, and the aggregate of such debt by nearly a third.

State debts have been incurred very largely for various developmental works. As we have seen, the State Governments undertake functions performed in other countries by Local Authorities or private enterprises, and this has caused their debts to increase with the development of the States. The net loan expenditure incurred by the States up to 30th June 1938 was as given in Table XIV, p. 146.

GRAND TOTAL		970

These figures refer to the amounts actually spent, and exclude those still unpaid. They show the nature of the debt, whether productive or unproductive. No data are available by which it would be possible to show the actual proportion of productive debt for all States.

Details of the debts of the States, Local Governments and semi-Governmental authorities are to be found in Tables 12 to 14 in Part III.

Public Debt Charges

The debt charges of all Governments for 1937-38 are set out in the following table, which is analogous in its arrangement to Table XIII (see above, pp. 145-6). Both tables show the predominance in peace-time of State debt, and the high proportion of the debt charges which is payable abroad, mostly in London.

Public debt charges and net losses of the several States, in 1937-38 and 1940-41, are set out in Table 15 in Part III, and the interest payable by Local Government and semi-Governmental authorities respectively in 1937-38, by States, is set out in Tables 16 and 17.

Special interest attaches to Table 15, which gives interest, sinking fund and exchange charges of the several States, in millions of pounds and per head of the population, as well as the net losses on these charges after deducting earnings. It fully demonstrates the great difference between New South Wales and Victoria and the other States, but especially between the former and the "claimant" States of South Australia, Western Australia and Tasmania. The net losses per head of the population are much higher in the three last named than in the other States. Especially is this true of Tasmania, where the debt charges per head are comparatively moderate — only those of Victoria are lower — but where the proportion of these charges given as net losses is phenomenal, making such losses per head the highest for all States. On the other hand, it must be admitted that the regular occurrence of substantial net losses in all States, including the eastern ones, shows that none of them has in the past pursued a policy of what may be strictly termed "sound finance" according to old-fashioned principles.

The losses arise from works partially or wholly unproductive and from deficits financed from loan funds. The Commonwealth Grants Commission has examined the position with special reference to South Australia, Western Australia and Tasmania, and concluded that "no irrigation, land settlement or railway authority charges consumers sufficient to cover its costs, and the combined deficits of these undertakings have an un-stabilising effect on political conditions and on public finance. There is a further more cogent reason why the system of not making adequate charges for economic services is unsound. If the deficiency is charged to

³ Excludes interest due from Local to Central Governments.

⁴ Excludes interest due from Local and semi-Governmental authorities to the Central Governments.

the taxpayer, it will fall mainly on the higher grades of taxable income. The benefit of the lower charges on economic services goes predominantly to the larger user, but in this case he is usually the landowner. This applies to the main services on which loan money is spent in Australia, viz. roads, land settlement, railways and water supply. Charges for these services, which are less than the annual cost, and which make no adequate levy on the persons benefited, act as a subsidy to land values. High land values in a community dependent on primary production are a definite hindrance to such production.”¹

✓ To sum up : the debt charges of the Commonwealth are mainly on unproductive debt resulting from two great wars, whereas those of the States are due to the investment of Australian and foreign capital in productive enterprises of many kinds and also in unproductive works. The loan policy of the States is not above criticism, for reasons stated above, especially in South Australia, Western Australia and Tasmania, which receive special grants from the Commonwealth to assist them in trying to maintain Budget equilibrium.

V. WAR CHANGES

As in other Federations studied here, the war has considerably increased the relative importance of the Commonwealth in Australian finance. Its expenditure has become paramount. Tables 1 and 2 in Part III give the Commonwealth revenues and its expenditures from Consolidated Revenue in 1940-41 (actual figures) and 1941-42 (Budget figures). A comparison of these tables with Tables VI, VII, XI and XII will show some of the changes that have taken place. The Commonwealth expenditure from revenue budgeted for in 1941-42 is more than twice as large as that of 1937-38 — the increase is 109 per cent. The proportion of the total devoted to defence or war has risen from 8 to 44 per cent. In 1940-41, before the proportion of secondary functions was temporarily swelled by the introduction of Commonwealth child endowment, the proportion of expenditure from revenue devoted to war was 49 per cent. The increase in Commonwealth loan expenditure was much more phenomenal. Omitting redemptions it amounted to £4·5 millions in 1937-38 and to £151·7 millions in 1941-42 (Budget estimate) — an increase of 3234 per cent. The loan expenditure on defence rose from £1·7 millions to £149·1 millions. Expenditure from Consolidated Revenue and Loan Fund combined has risen from £77·7 millions in 1937-38 to £303·7 millions in 1941-42, or, if the official totals are adopted, from £90·9 millions to £321·9 millions. Expenditure on defence or war from revenue

¹ Commonwealth Grants Commission, Eighth Report (F. 1357, 1941), pp. 75-81.

and loan rose from £7·7 millions to £215·7 millions. In introducing the Budget for 1943-44 in the House of Representatives Mr. Chifley, the Commonwealth Treasurer, showed that half the whole National Income is being devoted to the war, and taxation in the current financial year is expected to reach £270 millions as compared with £74 millions in 1938-39. Up to 30th June 1943 the total cost of the war to Australia reached £1107 millions, of which £363 millions were provided by taxation, £474 millions by loans from the public and £259 millions by discounting Treasury Bills with the Commonwealth Bank.

At the same time, the greatest possible economy is taking place in civil expenditure. Loan expenditure is confined as far as practicable to war needs. There has been a considerable contraction of loan expenditure on public works other than defence. The Loan Council, held in Melbourne on 11th August 1942, sanctioned a programme involving the expenditure of £12·9 millions, a saving of no less than £6·7 millions on the programme of the preceding year. All works sanctioned were directly or indirectly for defence, or subject to inescapable commitments or of special character. A substantial reduction took place in loan expenditure on State and semi-Governmental works.

As elsewhere, the increase in expenditures has led to an increased predominance of the Centre in the field of taxation, and to greater progression in the revenue system. [We have already seen (pp. 117-19) that the Commonwealth has for the period of the war displaced the States from the income tax and entertainments tax field. Commonwealth revenues have risen from £75·1 millions in 1937-38 to £152·0 millions (Budget estimate) in 1941-42, or by 102 per cent. At the same time, Group I (Progressive Taxes) rose from 10 to 23 per cent of total Commonwealth revenues, and income tax (on individuals and companies combined) from 13 per cent to 33 per cent, or 41 per cent if pay-roll tax and war-time company tax and supertax are included. These figures are previous to the surrender of State income taxes, which took place in 1942.]

Thus a high and increasing proportion of the national income is diverted to the war effort, though Table IV on page 124 shows that this process only got fully under way after some delay. Meanwhile that income is rising in spite of the interruption of oversea trade and the consequent effect on "primary" exports.¹ Industrial reorganisation to meet war needs is having a special advantageous effect on the industrial States, New South Wales and Victoria. These factors will not remain without repercussions in the field of finance.

¹ The latter has meant, among other things, that Australia has not been able to repatriate her sterling debt to the same extent as Canada and India.

CHAPTER VI

THE PUBLIC FINANCE AND NATIONAL ECONOMY OF SOUTH AFRICA

I. THE NATIONAL ECONOMY

THE Union of South Africa has an area of somewhat less than half a million square miles. It is, therefore, four times the size of Great Britain and twice that of France. Its population is 9·6 millions, of whom a shade over 2 millions are European. The mainspring of its economic activity at the present time is gold mining. In recent decades agricultural and pastoral production has been considerably increased with a view to supplying not only the Union's own requirements but also the demand for export abroad. This has been combined with an enormous expansion in manufactures which has been especially noticeable in recent years. Prior to 1925 the tariff was mainly a revenue one, but under the revised tariff of that year a policy of protection for industries in the Union was systematically undertaken. South Africa is fortunate in being the producer of a commodity which is always in general demand — gold, which has been mined there since 1886 and in considerable quantities since 1896. She produces about one-third of the world's gold and is easily the greatest producer.¹ From 1923 to 1929 there was prosperity combined with expansion in the Union. The years 1929 to 1932 were depression years, but after 1932 the price of gold leapt up to new high records, and this not only gave an enormous impetus to mining itself but revived to a very substantial degree the economic activity of the Union. The large imports of capital, mainly British, have been due to expansion in mining, chiefly diamonds and gold, and in transportation, mainly railways. Professor Frankel in his comprehensive study on *Capital Investment in Africa* ² brings this out clearly. In dealing with the economic structure of the Union he shows that South Africa is largely dependent, as we have shown Canada to be, on a very restricted number of exportable products. There are few countries in the world so dependent on foreign trade as is the Union. In 1937 all mineral exports accounted for 75·3 per cent of the total export trade (diamonds for 2·8 per cent and gold exports for 69·3 per cent); wool exports for 10·6 per cent; and all agricultural and pastoral exports 23·5 per cent.

¹ Vide G. Findlay Shirras, "The Position and Prospects of Gold", *Economic Journal*, June–Sept. 1940. Since the peak year 1940 this percentage has increased to over that figure: 14 million fine oz. in 1940 out of an estimated world production of 40·5 millions, and in 1942 14·8 million fine oz. out of a world production of 36 millions.

² Issued by the Committee of the African Research Survey under the auspices of the Royal Institute of International Affairs. Oxford University Press, London, 1938.

Thus mineral and agricultural, including pastoral, exports account for 98·8 per cent. Over the thirty years gold alone has formed nearly 60 per cent of the total, and it is on the mineral industry that the modern economy of the Union has been built. To an ever-increasing extent the finances of the Union depend on the direct and indirect taxation of gold mining. The Minister of Finance, Mr. Hofmeyr, stated in September 1942 that the fact that the maintenance of gold production was essential not only for South Africa's war effort but for the cause of the United Nations had come to be appreciated generally. "In the last financial year", he said, "the gold-mining industry contributed directly over 30 per cent of all the State income on revenue and loan accounts and a good deal more indirectly." The severity of taxation on gold-mining income was illustrated by the Transvaal Chamber of Mines in its evidence to the Departmental Committee on Mining Taxation in 1935 by the following approximate rate of similar taxation expressed as a percentage of taxable profits in other gold-producing countries: Union of South Africa 42; Rhodesia 23; Australia 18; U.S.A. 14 to 18; Canada 13 to 19; West Africa 12. Another characteristic of the Union economy is the degree to which agriculture is assisted for the benefit of Europeans engaged in that industry. A large part of the burden falls on those export industries, such as gold, which do not receive off-setting advantages and cannot shift the tax. The burden has also grown on mines because of the protection granted to manufacturing industry since 1925. Except in the case of wool there is no important agricultural commodity which is not dependent on the maintenance of an artificial internal price structure or on some similar kind of protection. While anxious not to give a one-sided or *ex-parte* view I agree, generally, with Professor Frankel when he says, "There has grown up in the Union a system of tariffs, subsidies, quotas, price regulating and marketing schemes, which is remarkable in its wide ramifications, contradictions and complexities. Nearly every important agricultural commodity for which an appreciable local market exists has now to be sold at internal prices above the corresponding world prices. Moreover, the rates structure of the railways has been mainly devised to conform with the system whereby agricultural, particularly export products are subsidised by means of artificially low transport charges. Since Union too, very large sums have been spent on the construction of unpayable branch lines in order to stimulate farming, often in quite unsuitable areas. The low contribution made by agriculture to the direct revenues of the Central Government is due both to the special exemptions under the Income Tax Acts and to the low net incomes obtained from agricultural operations."¹ Thus, in spite of the efforts of the Government to put

¹ Frankel, *Capital Investment in South Africa*, Oxford University Press, 1928, pp. 121-2.

“European” agriculture on a secure basis, it is more dependent than ever on the remainder of the Union economy. More than one-half of the Union’s native population is on farms, and of these 70 per cent is occupied in European areas. The policy is to pluck the golden goose with as little squealing as possible to enable agriculture and industries to be in a position sufficiently sound to hold their own when the Union will no longer be primarily dependent on gold.

The total amount of foreign capital invested between 1870 and 1936 in the Union of South Africa is approximately £523 millions. Of this price capital is £250 millions, of which two-thirds is in mining, and of the remainder three-fifths is in landowning, banking, insurance and investment companies and two-fifths in commerce, industry and agriculture.¹ These estimates show that, in return for the gold, diamonds, etc., the Union has become equipped with foreign capital in the form of machinery and other paraphernalia of an advanced industrial economy. When it is remembered how small the population is, and how the development of the Union has been determined to a very large extent by the interests of the white population, these foreign capital investments are remarkably high. Nevertheless, investments have not resulted so far in a high standard of living for the population as a whole, white, native or coloured. The entire population is not employed at the optimum level, *i.e.* at a level which would maximise the national output. Therefore the national income is still low per head of total population, and up to the outbreak of war, the flow of capital continued at such a rate that there were few, if any, signs of the Union ever becoming a creditor country. A debtor country should eventually increase its own national income so that it no longer requires capital from abroad, as has been seen recently in other parts of the British Commonwealth. The Union (except in mining — three-quarters of the foreign capital is invested in mines and in urban centres serving these mines) is a good example of a country in which the marginal efficiency of capital is low in most enterprises. This large investment of capital from abroad obscures the poverty of the great part of the population, native, coloured and European. The most urgent problem in the Union economy to-day is to increase the national income or to increase production, a gigantic task, and this means the development of non-material as well as material resources among all classes of the population, including coloured and poor whites. This development, as one authority somewhere phrases it, depends “on opening the doors of personal opportunity”. But in South Africa these doors remain closed to a large section of the population — coloured, native and European.

¹ Frankel, *op. cit.* Table 28

II. THE SOUTH AFRICA ACT

The Union brought about by the South Africa Act, 1909, was not the first attempt to federate the four main political divisions of South Africa. The first attempt was mooted in 1857, and again in 1877 when a permissive South Africa Act was passed by the British Parliament. It failed, but Sir Bartle Frere, Governor of Cape Colony and the first High Commissioner of South Africa, pushed on the idea of Federation. In 1880 the Sprigg ministry definitely formulated proposals for union to be considered by the delegates of the various States. The proposals again fell through, and after the battle of Majuba, 1881, the British Government abandoned the Transvaal. Even before this Cecil Rhodes had the idea of a federated South Africa under British rule with the assent of the Cape Dutch. Rhodes, who died at the comparatively early age of forty-nine, leaving some £6 millions to the public service, endowing 170 scholarships at Oxford for students of the Colonies, U.S.A. and Germany, and leaving £100,000 to his old College, Oriel College, Oxford, belonged to a group of statesmen who will live in the history of South Africa — Lord Milner, 1854–1925; Jan Hendrik Hofmeyr, 1845–1909; Sir L. S. Jameson, 1853–1917; General Louis Botha, 1852–1909; and Lord Selborne, High Commissioner of South Africa in 1907. Lord Milner, after being Under-Secretary for Finance in Egypt (1890–92) and Chairman of the Board of Inland Revenue in London (1892–97), became High Commissioner of South Africa in 1897 and continued in office until 1905. Milner had a great and strong mind and saw, in a way few of his contemporaries did, the advantages of a political union of the South African States. It was he, too, who saw the undoubted advantages of a customs union, realised in 1903, and of a unified transport system, railways, harbours and ports.¹ He saw, too, the advantages of a policy for agriculture, for industry and for education. He had a peculiar genius for finance, as figures were “real counters of thought to him and a balance sheet as lucid as a page of print”. Milner, in short, prepared the way for Selborne, his successor, who wrote a *Memorandum on the Closer Union of the South African Colonies*. After the Peace of Vereeniging, 31st May 1902, all four political divisions of South Africa were British colonies and in consequence their federation

¹ “Lord Milner had also taken advantage of every opportunity to terminate or minimise the injurious competition between the various railway systems in South Africa for the trade of the Rand. The railways of the Transvaal and the Orange River Colony were united under one management, the Inter-Colonial Council, administered as a joint concern; and agreements were concluded with the Cape and Natal Governments at the Railway Rates Conference of 1905. This movement of closer railway union contributed in no small way towards the attainment of political union” (M. H. de Kock, *The Economic Development of South Africa*, London, P. S. King & Son, 1936).

was easier than hitherto. In 1909 the National Convention met, first in Durban and then in Capetown, and had representatives of all the South African colonies. The South Africa Act, 1909, resulted and on 31st May 1910, *i.e.* on the eighth anniversary of the Peace of Vereeniging and thirty-three years after the Permissive Federation Act of 1877, the four colonies finally entered upon the complete union of the wide Dominion of to-day.

The Act itself is of special interest to the student of Federal Finance. It differs from the Canadian and Australian Constitutions in that the Provinces of the Union have no written Constitution superior to ordinary law which guarantees their rights, as in the cases of the Provinces of Canada and of the States of Australia. The Union Parliament could abolish the provincial system if or when it likes. There is nothing in the Statute of Westminster applicable to the Union of South Africa which guarantees the Constitution. It cannot, therefore, be said that the relationship of the Union Government to the Provinces is really federal in character. Two things seem clear in this connexion. In the first place, the provincial system in the South Africa Act, 1909, was, as it were, a sop to those in favour of a federal form of government. In the Act it is the unitary system that is really established. Secondly, the continuance of the provincial system at the present time is to be explained as due to fears still entertained in some parts of the Union, notably in Natal, of the domination of the Union Parliament and the Union Government, rather than to any functions which the Provincial Governments perform. Direct taxation granted to the Provinces under section 85 (i) was withdrawn from them by Act No. 46 of 1925, amending the financial relations between the Union and the Provinces, as set out in the Financial Relations Act of 1913.¹ From the first the Provinces have relied on subsidies from the Union to a very large extent. In 1937, for example, 52 per cent of their total revenue was from subsidies (*vide* Table IV below) as compared with 8 per cent in Canada. For this reason more than any other perhaps, the Provinces have not been genuinely self-governing. The Provinces and *not* Local Authorities are entrusted with elementary education, hospitals, poor relief, roads and bridges, racing, betting, game and fish preservation. Under section 85 (vi) Provinces are also in charge of "municipal institutions, divisional councils and other local institutions of a similar nature", and so the Provincial Government is of immediate concern even to a town council of the size of Johannesburg.² On the other hand,

¹ This Act was modified by Acts No. 9 of 1917, No. 6 of 1920, No. 5 of 1921, No. 5 of 1922, No. 21 of 1924, No. 46 of 1925, No. 39 of 1927 and No. 50 of 1935.

² Cf. Maud, *City Government, the Johannesburg Experiment*, Oxford, Clarendon Press, 1938.

problems relating to native affairs, to the public health of the country as a whole, to defence, justice, higher and technical education, agriculture, commerce and industry, railways and harbours are administered exclusively by the Union Government. The Union Parliament has "full power to make laws for the peace, order and good government" of South Africa under the South Africa Act. The financial powers of the Provinces are limited and they are, in effect, as the Provinces of Canada and the States of Australia are not, pensioners of the Union Government instead of sovereign Governments. The Municipalities differ from those in practically every other country of the world. In most countries it is usual for Municipalities to obtain grants for education, police, health and other purposes, and the grants are dependent on a satisfactory standard of performance by the Local Authority. In South Africa not only is the scope of Municipal Government limited but Local Authorities have practically no help or supervision from the Union or Provincial Governments. The Municipalities, therefore, have been forced to finance themselves by profits from public utilities (water, transport, electricity, etc.), and even on sewerage and sanitary services profit is frequently made. Only about half their annual revenue in 1937 was met by the taxation of property, as will be seen from Table IV below. Rating differs from the English model, as owners bear the whole burden, occupiers being exempt, and the rating power of Local Authorities is limited to an annual maximum by legislative enactment.¹ The English method of assessment, the basis being annual rental value, is not followed in South Africa, where land and improvements are assessed separately on the capital or selling value in each case. Since education, poor relief and hospital administration do not fall definitely within the sphere of South African Municipalities, they do not generally provide for the social or cultural municipal life, although the bigger Municipalities have housing schemes to provide for the needs of the poorer classes, both European and native;² nor do they make regular provision for poor relief. It is sometimes said that the urban native can relieve his own destitution by retiring to the rural areas reserved for native occupation or by relying on assistance from his family or friends.

The financial provisions of the Constitution are contained in sections 117 to 133 of the South Africa Act, 1909. A Consolidated Revenue Fund and a separate Railway and Harbour Fund were constituted under section 117: "All revenues, from whatever source arising, over which the

¹ *Vide* Rating Proclamation (No. 38 of 1902). Maud, *op. cit.* p. 54.

² Johannesburg, for example, has built the Orlando Native Township, and it has announced that it intends spending another million pounds or more on another big housing scheme to take the place of the one on the Pretoria Road.

several Colonies have at the establishment of the Union power of appropriation, shall vest in the Governor-General-in-Council. There shall be formed a Railway and Harbour Fund, into which shall be paid all revenues raised or received by the Governor-General-in-Council from the administration of the railways, ports and harbours, and such fund shall be appropriated by Parliament to the purposes of the railways, ports and harbours in the manner prescribed by this Act. There shall also be formed a Consolidated Revenue Fund, into which shall be paid all other revenues raised or received by the Governor-General-in-Council, and such fund shall be appropriated by Parliament for the purposes of the Union in the manner prescribed by this Act, and subject to the charges imposed thereby." From the date of the Constitution of the Union, May 1909, until April 1913, when the Financial Relations Act came into force, the funds required by the Provinces were provided by grants from the Union Exchequer. The Act of 1913 transferred to the Provinces certain taxes and fees, *e.g.* totalisator taxes, fees (school and hospital fees), licences (dog licences, licences for game hunting, trading and professional licences), auction dues and other receipts connected with provincial matters as defined in section 85 of the South Africa Act. At first little use was made of these powers but later, with the growth of provincial expenditures, resort to them became indispensable. The proceeds of the transfer duty on fixed property, licences for the sale or supply of liquor and native pass fees are collected by the Union and assigned to the Provinces under the Financial Relations Act. These revenues are, in the words of the Report of the Provincial Finances Commission, 1923, "revenues over which the Provinces have no control and in regard to the levying of which the Provinces have no responsibility". These revenues are uncertain and, while encouraging expenditure in good years, they have caused, by their shrinkage in years of depression, great difficulties. The Financial Relations Act, 1913, based the amount of subsidy on the expenditure for any year — it was to be one-half of such expenditure — but if the expenditure for any year exceeded the expenditure of the previous year by more than $7\frac{1}{2}$ per cent, that Province was to get one-third instead of one-half of that excess as subsidy. A special subsidy of £100,000 per annum was granted to Natal and the Orange Free State, as they were less favourably placed than the other two Provinces. The expenditure of Local bodies within a Province ranked as ordinary expenditure of the Province itself. This provision was necessitated by the predominance of Local expenditure in the Cape Province. The Provinces were also permitted to include the annual interest and debt redemption payments as part of their ordinary expenditure for the assessment. Owing to the increase in expenditures mainly on education, roads, hospitals

and poor relief, the Provinces were given in 1917 additional powers to raise taxation in respect of licences for places of amusement, and an increase of 15 per cent was permitted in the assessment of the subsidy for education, the largest item, and 5 per cent for other expenditures. In the post-war crisis of 1921 the cutting-down of subsidies led Provincial Governments to resort to their powers of taxation, but this met with opposition from their legislatures and the deficits were met largely by borrowing. In 1922 the Baxter Provincial Finances Commission was appointed to report on the whole system of financial relations of the Provinces with the Union. In its Report the Commission recommended a new basis for subsidies, viz. by reference to the number of pupils in average attendance. It also suggested somewhat radical changes in taxation which were adopted in the Provincial Subsidies and Taxation Powers Amendment Act, 1925. This Act withdrew from the Provinces the general power of direct taxation, derived under section 85 (i) of the South Africa Act, 1909, as direct taxation on the part of the Provinces had given rise to a large number of cases on the validity of the taxing ordinances read in the light of the Constitution. The Provinces were given the power under the Act to raise taxes on vehicles, including motor vehicles ; a wheel tax ; an amusements tax ; taxes on persons other than companies and on the incomes of persons other than companies, subject to certain limits ; a tax on companies other than mutual life insurance companies ; a tax on the ownership of immovable property ; the taxation of racing and betting and the dissemination of betting information ; licences including (1) licences for dogs outside urban areas, (2) licences to own or drive any motor and other mechanical vehicles, (3) licences on the importation for sale within the province of goods from beyond the borders of the Union. Licences in respect of trade, professions and occupations were taken over by the Union Government but the proceeds were transferred to the Provinces together with the proceeds of transfer duty, liquor licences and native pass fees. Under Act 17 of 1938 the Provincial Governments may authorise the carrying-out of professions and callings without payment and are then reimbursed by the Union Government for the loss of such revenue. Under Act 33 of 1939 the Cape Provincial Administration is paid an annual subsidy of £160,000 in lieu of importers' licences. A Consultative Committee consisting of the Administrator and the Executive Committee of each of the four Provinces was appointed under Act No. 50 of 1935 as a result of the Roos Provincial Finance Commission which reported in 1934.¹ The Minister of the Interior is the permanent President. The Committee meets to discuss matters common to the Provinces. The Act of 1935 also provided that the outstanding capital loans made to the

¹ U.G. No. 46, 1934.

provinces prior to the 1st April 1935 to meet deficits on revenue account were, together with interest charges upon these loans, assumed by the Union Government. As the annual subsidy to Natal was increased from £75,000 to £125,000, the Provincial Council of Natal could pay to the city of Pietermaritzburg compensation for the loss of prosperity through its having ceased to be a seat of Government. By the National Roads Act ¹ the Provincial taxpayer was given considerable relief, as the National Road Board took over the payment of interest and redemption charges on loans raised prior to 1st April 1935. The National Road Board votes the grants for the construction, repair and maintenance of roads payable to the Provinces whose duty it is to carry out this work in accordance with plans approved by the Board. This is interesting as yet another indication of the control of the Centre over the units in the sphere of public finance.

III. GOVERNMENT REVENUES AND EXPENDITURES

The following table, which is in two parts, shows the increase in Government expenditures and revenues in the Union of South Africa : ²

* Financial years beginning 1st April.

If we take the national income of South Africa and express the Union, Provincial and Municipal revenues and the total Union expenditures from revenue and from loan as a percentage of it, we find that South Africa, as compared with the United States, Canada and Australia, is in a favourable position from the viewpoint of the burden of taxation. The national

¹ No. 42 of 1935.

² Municipal data are not available.

income estimates are those of Professor Frankel and his collaborators.¹ They were quoted by Mr. J. H. Hofmeyr, Minister of Finance, in presenting his Budget to the House of Assembly on 25th February 1942, when he stated that "Hard though the saying may appear to be to those who are smarting under the increased burdens imposed in recent years, this country is still, by comparison with others, lightly taxed". The estimates for 1940-41, 1941-42 and 1942-43 are our own and are based on Professor Frankel's estimate after allowing for the increase in prices and assuming that the increase in production was not less than the increase between 1939-40 and 1940-41, a safe estimate. The data are given in the following table :

TABLE II
GOVERNMENT REVENUES AND EXPENDITURES EXPRESSED IN TERMS OF THE
NATIONAL INCOME

	1937-38	1940-41	1941-42	1942-43

ii. Loan expenditures	5	10	10	9
iii. Total	14	24	25	25
iv. Defence only	1	10	14	15

Note—For the years 1941-42 and 1942-43 it has been assumed that provincial and municipal expenditures have not increased and are approximately the same as in 1940-41. Provincial revenue figures exclude all grants and subsidies.

¹ These figures refer to revenues collected by, not to those available to, the various Governments.

The percentages in the table opposite are particularly striking when compared with those of other Federal Governments. War expenditure, it may be noted, was 10 per cent of the national income in 1940-41 as compared with 15 per cent in Canada and 40 per cent in Great Britain. In 1942-43 the percentage in the Union of South Africa is 15 per cent and in Canada over 40 per cent (including gifts to the United Kingdom).

It will aid the understanding of the tables below if the distribution of the national income is remembered. The following figures are for the year July 1938 to June 1939 (the figures in brackets are for the corresponding period of 1940-41); they are in millions of pounds. Mining 81·5 (100); manufactures 69·7 (85); commerce 53·8 (60); farming 50·0 (60); railways 23·9 (27); defence 0·0 (24); Central Government 17·5 (17); Provincial Government 15·0 (15); Local Government 8·0 (8); education, professions, etc. 12·4 (12); rent 27·3 (28); others 35·7 (36) — total 394·8 (472). The details of the national income were as follows: available for consumption 316·2 (367); net investment 56·8 (31); dividends and interest paid abroad 20·0 (19); war expenditure 1·8 (55). Note the importance of mining and then of manufactures as compared with the place taken by agriculture, which, as has been observed above, is subsidised. The increase in war expenditure by £53 millions, the decrease in net investment by £25 millions and the increase in the income available for spending by 10 per cent after allowing for war expenditure, are noteworthy.

Tables III and IV summarise overleaf the revenues of South Africa for the Union, Provinces and Municipalities in four main groups for the pre-rearmament year 1937-38.

It is sometimes said that it is difficult to discuss as a whole the tax structure of a Federal system in which a large proportion of the total governmental revenues and expenditures are provincial and local. The incidence of taxation, the services provided by the various Governments and the transfer expenditures are problems particularly complicated in such circumstances. Such a difficulty does not arise in the Union of South Africa as the Centre predominates to an unusual degree. The revenues collected by the Union in 1937-38 were as much as 66 per cent of the revenues of all Governments as compared with only 17 per cent in the case of the Provinces (excluding subsidies from the Union Government) and 17 per cent in that of Municipalities (revenues available to the Union, Provinces and Municipalities were respectively 55, 28 and 17 per cent of the total). Moreover, subsidies from the Union to Provincial Governments play a much greater part in Provincial revenues than is the case in any of the other Federal systems studied.

The system as a whole has certain well-defined characteristics. In the

¹ Included under income taxes.

first place, it is neither highly progressive nor highly regressive, although it tends to the regression inherent in consumption taxation. Progressive taxes (all Governments) are 11 per cent and consumption taxes 47 per cent of the total revenues. The income tax is not steeply progressive as it is, for example, in Canada, and the exemption limits compare very favourably with those in many other Federal Governments. It is only to this 11 per cent that the principles of progression were applied in 1937-38 to redress the regression. At the same time, the high taxation of mining (especially gold mining) is on surplus as is the income tax on individuals, and in this respect is not on costs like indirect taxes. In 1937-38 37 per cent of the Union's revenue was from business taxation and 25 per cent was from mining. It may be argued that the South African system has some degree of balance, although regression is noticeable. Again, the South African system has also the characteristic of efficiency, not merely in its narrower sense of collecting existing taxes with economy but also in its wider sense in collecting a given amount of revenue with the least burden on the national income. There are not the divided jurisdictions, the duplicated taxation machinery and lack of uniformity that are to be found in some other Federal systems, especially in the United States, Canada and Australia. Lastly, the position of Municipalities in the tax systems is exceptional. The Municipalities do not have to finance, as is customary elsewhere in Federal systems, education, hospitals and poor relief, and therefore their scope is limited. Their sources of revenue are from rates and to an unusual degree from the net profits of public utilities such as the provision of gas, electricity, water, buses and tramways.

The total expenditures amounted to 15 per cent of the national income. The data exclude loan expenditures and those of the railways and harbours, which are self-supporting and separated from the Consolidated Fund under the South Africa Act. Expressing expenditures as a percentage of the national income does not give a reliable index of the burden of government, especially in comparison with other countries, unless accompanied by an analysis of expenditures. Some expenditures are on the primary functions of government, *e.g.* administration and defence. Others are on the social services, such as education, unemployment relief and public health. There is also the important group of developmental expenditures including transportation, which in the case of South Africa is of considerable importance. Expenditures may also be classified into collective services and transfer expenditures. To the former group belong most expenditures on primary functions and such expenditures on secondary functions as education and developmental expenditures including transportation. In 1937-38 non-transfer expenditures amounted to £40

¹ No separate figures are given in the Official Year Book of the Union of South Africa.

are comparatively small because of the small importance of unemployment relief.

The expenditures on the traditional "primary functions" of Governments, *i.e.* on legislation, administration and justice, defence, pensions

and debt charges accounted for 40 per cent of total public expenditures in the Union of South Africa. Law and police and defence are expenditures of the Union and not of Provincial and Municipal Governments (except for Municipal expenditures on police in Cape Province, Natal and the Transvaal). Debt charges are not high, 18 per cent for all Governments as compared with, for example, 27 per cent in Canada. Defence in 1937-38 was 5 per cent of the Union expenditure and 3 per cent of all governmental expenditures. Since the outbreak of war it has increased by leaps and bounds, the expenditure from revenue alone rising to 38 per cent in 1940-1941, 39 per cent in 1941-42 and 46 per cent in 1942-43. If loan expenditures were also included, the total cost of defence expressed as a percentage of the total expenditures would be as follows: 1937-38 4 per cent, 1939-40 8 per cent, 1940-41 42 per cent, 1941-42 55 per cent, 1942-1943 57 per cent.

Expenditures on education amounted in 1937 to 20 per cent of total expenditures. The Union is responsible for higher education, *i.e.* that above matriculation standard, including grants to universities and for agricultural education, research stations and the like. It spent £1.4 millions, or 4 per cent of its expenditure, on this, or 12 per cent of the total expenditure by Governments on education. Provincial Governments (which are entrusted with elementary and secondary education) spent £9.6 millions, or 55 per cent of their expenditures, or 88 per cent of the total expenditures by Governments on education.

European education is mainly State education, *i.e.* administered and financed by the State, private or local effort being very small. Non-European education, on the other hand, is only State-aided, *i.e.* partly supported and controlled by Missionary enterprise. The development of education in recent decades is set out in Table 18 in Part III of the Enquiry. It shows since Union a great increase in all branches of education. The percentage of pupils in post-primary European education has gone up from 11 per cent at the time of Union to 20 per cent in 1937, and the State has increased its expenditure from £9.65 to £24.66 per annum per pupil. Native education, on the other hand, has also considerably increased although the percentage of natives enjoying education is still small, 6 per cent in 1937 as compared with 20 per cent for Europeans. Only 2 per cent of native pupils receive some sort of post-primary education as compared with ten times that figure for Europeans. In 1937 the State spent nearly twelve times as much per pupil, and something like forty times as much per head of the population, on European as compared with native education. But it must be remembered that the discrepancy in education given is less than this because of the expenditure from Mission funds. At the same time, differences in the standard of living between Europeans and

natives is very great, and this has to be remembered in comparing expenditure. It does not, however, entirely explain the great contrast between European and non-European education. The main expenditures of the Provinces are on education — 55 per cent of the total in 1937–38. Public works, chiefly roads and buildings, accounted for 25 per cent in the same year.

In Municipal expenditure the chief item is the debt charges,¹ which in 1937–38 amounted to 44 per cent of the total expenditures. This debt was incurred mainly for developmental items such as gas and electricity. This is seen in the following table :

TABLE VII
CAPITAL EXPENDITURES OF MUNICIPALITIES IN 1937
(£ thousands)

	Cape of Good Hope	Natal	Transvaal	Orange Free State	Union
Roads and bridges . . .	586	129	694	42	1451
Public health . . .	201	80	476	4	761
Electricity supply . . .	1260	157	1087	118	2622
Water supply . . .	432	116	256	29	833
Properties . . .	410	52	2259	33	2754
Other . . .	390	483	539	41	1453
Total . . .	3279	1017	5311	267	9874

We have seen that 66 per cent of the revenues of all Governments are collected by the Union itself. In relation to the Provinces — Cape of Good Hope, Natal, Transvaal and Orange Free State — this is significant. In the first place, the main sources of income that would cause inequalities in Provincial revenues, *e.g.* mining revenues, are not allowed to remain with the Provinces or the Municipalities. Secondly, the subsidies amount to 52 per cent of the Provincial income, the subsidies themselves being based on an objective basis, *viz.* educational needs. There is, therefore, a greater uniformity of treatment by all Governments in regard to South Africans than is perhaps usual in other Federations. Railway policy, too, subsidises agriculture by freight rates, and therefore inequalities that would arise among different areas are ironed out.

¹ The figures for debt charges in Tables V and VI include redemption and other payments as well as interest. This should be borne in mind when comparing them with the corresponding figures in other chapters of this Enquiry, of which only the Australian ones include all these items.

IV. THE PUBLIC DEBT

The public debt of South Africa has been incurred, as elsewhere, to meet the cost of public works and also emergencies and temporary deficits. If productive debt is taken to mean self-supporting debt which pays its full interest and amortisation charges directly, then a large part of the debt, 61 per cent of the debt in 1939, may be regarded as productive — *e.g.* the debt on railways and harbours and posts and telegraphs. The debt incurred by Municipalities for public utilities would be, to a large extent, also classified as productive. The South African railways and harbours, for example, in the year ended 31st March 1942, produced a surplus of over £6 millions which was allocated to the reduction of interest-bearing capital (£2 millions), a special contribution to the renewals fund (£1 million) and a credit to the rates equalisation fund (£2·4 millions). The remainder went to reduce the deficiency in the pension and superannuation fund (£0·5 million) and as a contribution to the railway institute fund (£0·1 million). Part of the public debt which is not directly self-supporting is represented by tangible and useful assets which increase the productive power and therefore the taxable capacity of the Union. The unproductive debts include also the dead-weight debts representing deficits or bad investments. A large part of the total debt incurred for expenditure on unproductive works has from time to time been paid off, and is, therefore, not reflected in the present unproductive debt of the Union. A feature of the debt is the proportion payable in foreign currencies: 36 per cent of the Union debt is of this nature. In recent years, as will be seen from Table 19 in Part III, there has been a reduction in this debt. It should be remembered that with exchange control as a weapon of Central Bank and national economic policy all commitments should be under the control of one body. In the Union of South Africa under section 124 of the South Africa Act, the Union took over the debts of the four Provinces and also (under sections 121–3) all cash, securities, crown lands, public works, movable and immovable property and all rights in mines and minerals. Since that date the Provinces borrow only from the Union Government and compete with each other following a procedure similar to that in Australia.

It will be seen from the table overleaf (VIII) that the greater part of the public debt of the Union of South Africa in 1939 was productive.

The spread of the debt between the Union, Provinces and Municipalities is seen in the following table :

TABLE IX

DEBTS OF ALL GOVERNMENTS IN 1939

(£ millions)

Union	Provinces	Municipalities	Total
279	(14) ¹	60	339
Percentages			
82	(4) ¹	18	100

¹ Provincial debt is borrowed from the Union.

The outstanding features of the public debt may be summarised thus :

(1) The public debt is increasing with the development of the Union.

With the increased costs of Governments — the Union, Provinces and Municipalities — due mainly to the great extension of governmental activity, this growth is unavoidable.

(2) The net increase in public debt is not greater than the amount of interest received by the Governments.

(3) The decrease in the external debt.

(4) The greater part of the public debt of the Union is productive. In 1939 only about 37 per cent of the interest payable in respect of the gross public debt was the cost of serving unproductive debts, accumulated deficits and war expenditures, and may be regarded as a burden.

(5) The wisdom of making provinces borrow from the Union, thus preventing borrowing of a dead-weight character.

The conclusion which we come to is that the public debt of the Union is on a firm basis.

V. THE SOUTH AFRICAN TAX STRUCTURE AS AFFECTED BY THE WAR

Compared with the other Federations, there was not much unemployment in South Africa at the outbreak of war, nor does there appear to have been much capital equipment standing idle. Not many plants were closed down or working short time.

Only the supply of food was in a different position — great surpluses of foodstuffs had been dumped abroad for years in consequence of the great subsidies to farmers, and food consumption consequently could be increased as a result of increased employment without causing a rise in the demand for men and materials for food production.

In South Africa, Government interference in production, outside of its control of the armed forces and of a few munition plants, has been small. It was only in 1942 that the Union was swinging over to a controlled economy. The latest development can be seen at a glance in the table overleaf.

In the year 1940–41 the South African expenditure for war purposes was £56 millions. For 1941–42 it was £72 millions and for 1942–43 it was estimated at £80 millions. In the financial year 1939–40 of the total Government expenditure of £132 millions (compared with £58 millions¹ in 1937–38), £56 millions was for defence and £56 millions was on loan account (compared with £19 millions in 1937–38). In addition, loans amounting to £8·4 millions were paid off. Since then more of South Africa's sterling debt has been repatriated; *e.g.* £40 millions of stock were covered by a British Treasury vesting order made in December 1942.

¹ Including gross expenditure on Posts and Telegraphs (£4 millions).

TABLE X
WAR BUDGET FIGURES, 1941-42 AND 1942-43

1941-42		
Revised estimate of revenue		£79,533,000
Revised estimate of expenditure		73,800,000
		£5,733,000
1940-41 surplus carried forward		494,493
Estimated surplus at 31st March 1942		£6,227,493
Of which to be transferred to loan account		6,000,000
Leaving a net balance to be carried forward to 1942-43 of		£227,493
1942-43		
Estimate of Expenditure	£88,366,170
Estimate of revenue on existing basis of taxation	£78,643,000	
Plus balance carried forward from 1941-42	227,493	78,870,493
Leaving a shortfall of	£9,495,677
Which was to be met as follows :		
Additional customs and excise duties on tobacco and petrol	£1,570,000	
Additional death duties	75,000	
Increase of gold mines special contribution from 16 to 20 per cent	1,640,000	
Trade Profits Special Levy	4,000,000	
Tax on individuals	640,000	
Surcharge on income tax	910,000	
Land sales profit tax	450,000	
		9,285,000
Leaving an estimated deficit at 31st March 1943	£210,677

This means that in return for goods received in the past South Africa supplies goods now, whether gold or other commodities, and thus far eases the strain on British finances, as long as Britain wants and can use South African gold.

Thus, up to 1942 the major part of South Africa's war effort had so far been financed by loans. This was in marked contrast to Great Britain and the other Dominions, where, though large sums were raised by loans, taxation was in these years very heavy.

South African taxation was very light, [and apart from increased taxation of the gold mines and normal income tax, the other tax increases

have not made a serious difference to the weight of taxation. For it should be remembered that income tax rates before the war were very low in South Africa, and even a substantial percentage increase in the rates does not, therefore, mean that the absolute burden is great.

There are signs, however, that this state of affairs is going to change. In the year 1941-42 the buoyancy of the revenue was such that a surplus of more than £6 millions arose. This was used in reduction of loans. This means, in effect, that in 1941-42 one-half of the war expenditure of £72 millions had been paid out of revenue funds, whereas it was originally intended to pay £29 millions, or 40 per cent, from revenue and £43 millions, or 60 per cent, from loan. In 1942-43 a war expenditure of £80 millions was budgeted for to be paid half from revenue and half from loan, though this figure is likely to be exceeded.

The increased burden is being met by a great increase in taxation.

In Part III will be found further detailed tables of revenue and expenditure. The data are interesting because they show how, in order to meet expenditure connected with the war, taxation has been increased, notably in three directions, viz. in progressive taxation (personal income taxes and succession duties), in the taxation of companies (especially gold mines) and in consumption taxes. The requirements of the Union are now so great that the tax burden has to be widespread, and this has meant a judicious mixture as in the past of direct and indirect taxes, with the modern bias towards progressive taxes and the taxation of surplus. The present financial policy of the Union also attempts to draw off, in Mr. Hofmeyr's own words, "as much as we can of the actual surplus of purchasing power. That can be done by taxation and by certain types of borrowing. As far as borrowing is concerned, we have taken a definitely anti-inflationary step by using money borrowed in South Africa to cancel the repatriated stock held by the Reserve Bank. Moreover, we have, through the thrift movement, promoted voluntary savings with, as I have indicated, a considerable measure of success. But we have not done enough. There are far too many people who have not responded to the appeal to spend less and save more. There is still far too much money which is being spent lightly and unthinkingly without regard to the interests of the community as a whole. The time would seem to have come to consider the use of compulsory savings as a means of drawing off the surplus to which I have referred. The third method is taxation."¹

War taxation in the Union has been on the whole well distributed. The total expenditure has risen steeply since 1939, until in 1942-43 on Revenue and Loan Accounts it reached £140 millions, of which £88,366,000

¹ Budget Statement by Mr. J. H. Hofmeyr, Minister of Finance, House of Assembly, 26th February 1942.

are on Revenue Account. The method of meeting an estimated deficit of about £9½ millions is of special interest.

The existing Excess Profits Duty, which was raised in 1941-42 from 10s. in the £ to 13s. 4d., continues, but there is an ingenious tax, called the Trade Profits Special Levy, which is estimated to bring in £4 millions. Like the excess profits duty it is a deduction in calculating normal and super income tax. The rate of levy is a progressive one. Payers of excess profits duty may pay the duty on the difference between their present income and either their pre-war standard of income or a statutory percentage (8 per cent for companies and 12 per cent for individuals) on the capital employed by them in their business. The levy is charged on the difference between the statutory percentage and the actual profits earned. The result is to remove certain inequalities which have existed in the rate of taxation as between established companies and companies which have sprung up since the war and have no pre-war standard of profits. A company with a capital of £20,000 and a pre-war standard profit of £3000 is now required to pay no excess profits duty if its profit does not exceed £3000 and if it elects to be assessed on the basis of its pre-war standard. It, however, the test is the statutory percentage and not the pre-war standard, the company will pay excess profits duty on the difference between its present income (£3000) and 8 per cent of its capital of £20,000, i.e. on £1400. The Trade Profits Special Levy will amount to not more than half the rate of the excess profits duty (6s. 8d.). The increase of the gold mines special contribution from 17 to 20 per cent in 1942-43 will bring in £1,640,000 and is further proof of the great extent to which the Union is dependent upon its revenue from gold mines. The rate was increased early in 1943 to 22½ per cent, yielding an additional £910,000.

Another tax which was new to South Africa was the tax on profits arising from the sale of land as given in Table X, page 172. Any profit derived from the sale of fixed property which was purchased since October 1939 was liable to this tax, which was at the rate of 6s. 8d. in the £ if the property were bought between 1st October 1939 and 25th February 1942, and at the rate of 13s. 6d. after that date. The tax was estimated to bring in £450,000. Income tax is increased in two ways, though it is still light as compared with that in other Dominions and Great Britain. In the first place there is a tax on individuals — a flat-rate tax resembling the familiar personal tax payable to the Provinces — of £1 (£2 : 10s. on incomes over £250). All single persons earning £250 and over pay £2 : 10s., while married persons earning between £250 and £300 pay £1 and married persons earning over £300 pay £2 : 10s. Secondly, there is a 10 per cent surcharge on the amount of income tax and supertax paid during the year 1942-43. A small addition to succession duties (death duties) was

E. Social Security and Public Assistance

Federal expenditure under this head, apart from such heads as N.R.A., A.A.A. or C.C.C., is mainly administered by grants to States.

During the fiscal year 1939-40 the following advances were certified by the Social Security Board to the Secretary of the Treasury for Public Assistance and for Administration of the Unemployment Compensation Laws and State Employment Services :

(\$ millions)

	Public Assistance				Unemployment Compensation and State Employment Services			Total
	Old-age Assistance	Dependent Children	Aid to the Blind	Total	Social Security Act	Wagner-Peyser Act	Total

¹ The regions are as follows: (1) *North-eastern States*: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia (under Local Governments), West Virginia. (2) *South-eastern States*: Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana. (3) *Middle States*: Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri. (4) *Mountain and Great Plain States*: North Dakota, South Dakota, Nebraska, Kansas, Montana, Wyoming, Colorado, Utah, Nevada. (5) *South-western States*: Oklahoma, Texas, New Mexico, Arizona. (6) *California*. (7) *Pacific North-western States*: Washington, Oregon, Idaho.

² 1937 figures exclude public service enterprises, as do the corresponding expenditure figures in Table 12. This should be borne in mind when comparing the figures, and especially the percentages in the two tables.

³ No data are available for 1937. The figure of \$6700 millions is a rough estimate. The change between 1932 and 1937 is likely to have been very much less than in the case of National and State figures.

⁴ The definition of revenue is not quite the same for the National and for the other figures. The totals for all governments combined should therefore be used only with caution.

Source.—Statistical Abstract of the United States.

¹ Net debt is gross debt less sinking fund assets, including debt of public service enterprises, except in the case of State debt in 1937. State figures for this year represent funded or fixed debt less sinking fund assets, and exclude debt of public service enterprises. State figures for 1932 contain 1931 figures for 7 States. For regions see Table 11, footnote 1.

¹ National Government : fiscal year ended 30th June 1932. State and Local Governments : fiscal years ending on a date between 1st July 1931 and 30th June 1932. National Government figures include trust and related accounts totalling \$326.5 millions.

² Departmental expenditure and refunds of receipts. The former contains a few small items which, if details were readily available on a comparable basis, would have been classified under Protection to person and property and under Secondary Functions such as Education. All War and Navy Department expenditure is given under Defence, and that of the Department of Agriculture under Agriculture.

³ Separate figures for pensions are not available in the case of State and Local Governments.

⁴ National Government figures not readily available on a comparable basis. The amounts would be small. See also footnote 2.

⁵ Excludes hospitals but includes recreation.

⁶ Mainly poor relief.

⁷ Mainly postal deficiency.

⁸ \$319.0 millions Department of Agriculture, \$136.2 millions Agricultural Marketing Fund and \$125.0 subscription to stock of Federal land banks.

⁹ Expenditures of a capital nature out of revenue, e.g. for purchase and improvement of land, erection of new buildings, extension of water-supply systems, or purchases to increase the collection of libraries.

¹⁰ Estimate, subject to revision. Details are not available for all types of Local Government in all States.

Miscellaneous	4,012	2,393	2,695	3,161	3,319
Social security contributions of employers	7	950	1,196
NATIONAL INCOME	82,885	40,074	55,870	71,172	69,378

¹ These figures, taken from the Statistical Abstract of the United States, 1940, are based on a definition of national income differing slightly from that used by Mr. Richard Stone (see Tables 18—especially footnote—and 20 C, also Chapter III, Chart IV (p. 33) and Table VI (p. 38), and Richard Stone, *op cit*). Data on dividends, interest and corporate savings by industrial divisions from 1934 onwards are based on a different industrial classification than those for earlier years, though the changes are small for total income as distinct from specific items in particular industries.

II. Ordinary expenditures other than those listed under III.	2,775	3,746	3,920
III. Recovery and relief and other expenditure on agricultural aid, Civilian Conservation Corps, Tennessee Valley Authority, and similar projects, as well as social security pay- ments	4,235	3,880	5,290
IV. Total ordinary expenditures ³ . . .	3,299 ¹	3,440 ¹	4,535	7,010	7,626	9,210
V. Surplus (+) or Deficit (-) ⁴	+734	+738	-2,529	-3,210	-1,384	-3,542
VI. Surplus (+) or Deficit (-) apart from III	+1,025	+2,496	+1,748
B. PUBLIC DEBT:						
Bonds ⁴	12,125	12,111	14,250	14,936	23,602	27,572
Floating debt ⁴	3,907	3,047	4,603	12,076	10,301	8,550
Special issues to Government agencies and trust funds .	607	764	308	633	2,676	3,770
Total interest-bearing debt	16,639	15,922	19,161	27,645	36,579	39,892
Non-interest-bearing debt .	292	263	326	1,056	588	553
TOTAL GROSS DEBT	16,931	16,185	19,487	28,701	37,167	40,445

¹ 1929 and 1930 these figures include trust and related accounts, which are excluded from the official figures for later years. The figures for these accounts are liable to vary considerably from year to year. In 1935 the receipts under this head were of the order of \$400 millions.

² The discrepancy between this figure and that for 1930, although largely due to the depression, partly represents the exclusion of trust and related accounts. (See footnote 1)

³ Excluding public debt retirements.

⁴ Other than special issues to Government agencies and trust funds.

Government expenditure	101	161	215
Government defence or war expenditure	3	68	120

¹ Estimated.² Ordinary Expenditures of the National Defence Department.³ Including amounts charged to active assets.

Note.—Tentative approximate estimate of Net National Income in 1942 is \$7500 millions. Expenditure for war in the fiscal year ended 31st March 1943 was tentatively given in the Budget speech of 2nd March 1943 as \$3,802,765,000; this figure includes the \$1000 millions gift to the United Kingdom. Total Dominion revenue for this fiscal year was \$2,308,400,000; total expenditure \$4,469,958,000 (preliminary figures).

¹ 1940-41 figures are actual receipts; those for 1941-42 Budget estimates. The figures represent receipts of the Consolidated Revenue Fund, except that net revenues only of business undertakings are included.

² In the absence of separate data of individual and company income tax, the total income tax receipts have been split up in the ratio of assessments in 1939-40. In view of the repeated changes in the income tax law as more and more reliance has been placed on this source of revenue, there is a considerable margin of error in the figure given above.

³ Net revenues of Post Office only. These were net expenditures on railways.

⁴ Excluding business undertakings.

⁵ Excluding balance of interest on States' debts payable by States.

⁶ No details available. The figure of £1,100,000 is a rough estimate obtained by taking approximately the proportion of "Miscellaneous Receipts" (the head in the Budget accounts) represented by interest in 1940-41. In this way the Budget estimate of Miscellaneous Receipts for 1941-42 has been split up. The total of Miscellaneous Revenue in this table is not affected.

Source.—Commonwealth Budget Papers.

Payments to or for States	11,441	11,610	8.4	7.6
GRAND TOTAL	136,634	152,031	100.0	100.0

¹ 1940-41 actual figures, 1941-42 Budget estimates. The grand totals differ from those in the official accounts in that net expenditure only on business undertakings is included, and in that expenditure from excess receipts (£2,928,375 on defence in 1940-41) has been added to ordinary expenditure.

² Expenditure of defence departments from revenue (other than on pensions and debt services), and miscellaneous expenditure on account of the war of 1914-18.

³ Interest, sinking fund, exchange, and loan redemption and conversion expenses.

⁴ Soldiers' children education scheme (expenditure on account of 1914-18 war) and National Library.

⁵ Paid to States, but does not appear in State Consolidated Revenue accounts.

⁶ Includes expenditure on scientific research and similar items which have been included under education in the State figures (Tables 5 and 6 and Chapter V Tables XI and XII), as well as in other chapters, but cannot be separated out in this case.

APPENDIX I

*Abstract of the Leading Recommendations of the Royal Commission on Dominion-Provincial Relations*¹

THE Report which the Commission has prepared is the outcome of two and a half years of carefully planned study. In the present summary the aim is to set out the principal recommendations embodied in the Report and to indicate briefly the reasons for them. At the heart of the problem lie the needs of Canadian citizens. The basic problem before the Commission lies, therefore, in finding a way in which the financial position of the Provinces could be improved and assured, without disastrous financial consequences to the Federal Government on whose efficient functioning all Provinces are dependent. National unity must be based on Provincial autonomy, and Provincial autonomy cannot be assured unless a strong feeling of national unity exists throughout Canada.

The Commission did find one onerous function of government which cannot, under modern conditions, be equitably or efficiently performed on a regional or Provincial basis. This function is the maintenance of those unemployed who are employable and of their dependants. In reaching this conclusion (which is amply supported by the Evidence and the research studies) the Commission merely confirmed conclusions which had been reached by earlier Commissions. So firmly is the Commission convinced of the validity of this conclusion that, even when it comes to consider the situation which will arise if its main recommendations are not implemented, it proceeds on the assumption that the relief of the unemployed who are able and willing to work will become a Federal function.

Another function closely analogous to that of relief for employables is that of assistance to a primary industry (e.g. agriculture) in the form of operating cost advances. When relief is on a small scale the responsibility can be borne without difficulty by the Province. But in the event of widespread disaster with which a Province is unable to cope without assistance from the Dominion, or in the event that the Dominion by such means as an exclusive marketing organisation has already established effective control of the industry concerned, the Commission recommends that the Dominion should assume direct administrative and financial responsibility rather than render indirect assistance by way of advances to the Provinces affected.

The Commission's treatment of these expensive functions of government may be contrasted with its treatment of another expensive function, namely the payment of non-contributory old-age pensions. As the Federal Government is already paying as high a proportion of their cost as it can reasonably pay without assuming control of the administration of the pensions, and as the Commission was convinced that it is more satisfactory that the Provinces

¹ *Vide* Report of the Royal Commission on Dominion-Provincial Relations, Book II, Section G. The Appendix above is a summary of the abstract in the Report.

should continue to administer non-contributory old-age pensions, it could not recommend any further financial help to the Provinces in this connexion. But the Commission is of the opinion that if non-contributory old-age pensions were to be superseded or supplemented by a contributory system the latter should, for various reasons, be under the control of the Dominion.

There is, however, an important financial burden of which Provincial Governments can be relieved without any sacrifice of autonomy. This is the deadweight cost of their debt service. The burden taken up by the Dominion, if it were to assume this deadweight cost, would be less than the burden of which the Provinces were relieved because, as maturities occurred, the debts could be refunded more advantageously by the Dominion than by the Provinces. To this extent a saving would accrue to Canadian taxpayers. The Commission has, therefore, recommended that the Dominion should assume all Provincial debts (both direct debts and debts guaranteed by the Provinces) and that each Province should pay over to the Dominion an annual sum equal to the interest which it now receives from its investments. The reason for this proviso is that it would not be expedient that the Dominion should take over liability for a debt which represented a self-liquidating investment retained by a Province. Conditions governing future Provincial borrowing are outlined in detail in the Report.

In the case of one Province this recommendation as to debt requires an important modification. The Provincial debt of the Province of Quebec is low in comparison with the *per capita* debt of other provinces, and is an unusually low fraction of the combined municipal and Provincial debt of the Province. To meet this situation, which has arisen through the policy of this Province in imposing on municipalities onerous functions which are performed elsewhere by Provincial Governments, the Commission has recommended that the Dominion should take over 40 per cent of the combined Provincial and municipal net debt service in Quebec.

If the Provinces are relieved, in accordance with this recommendation, of the deadweight burden of their debt, it is not unreasonable that they should surrender to the Dominion the subsidies, whatever their character, which they now receive. Prince Edward Island alone would give up subsidies more than equivalent to the deadweight cost of its debt, and, as will be seen, this apparent loss will be more than made up in other ways. The abolition of the Provincial subsidies will be in itself no inconsiderable reform, for their history is long and tortuous. The subsidies have been based on no clear principles and it has been impossible to say whether or not different Provinces have received equal treatment.

The Commission had also to consider how to provide the Dominion with sources of revenue which would enable it to carry its new burdens. This enquiry (as will be seen) was combined with the consideration of efficiency and equity in taxation specifically entrusted to the Commission. There could be no question of increasing the legal taxing powers of the Dominion since these are already unlimited. But the Provinces, in return for the benefits which they would receive, and for further payments which the Commission finds it necessary to recommend, should be prepared to renounce some of the taxes which they employ (or are entitled to employ) at present.

The Dominion, for its part, should be able and willing to refrain from competing with the Provinces in respect of sources of revenue left to them and should leave the Provinces free to collect these revenues in whatever way appears to them most efficient even if the method of indirect taxation should be involved.

Just as the assumption of Provincial debts by the Dominion will lead to savings in interest from which taxpayers will benefit, so there are several taxes from which, if they are under unified control, as great a revenue can be obtained as at present with less hardship to the taxpayer. What is more important, a reorganisation of these taxes, of a character which is possible only if they are under unified control, can remove many hindrances which in the recent past have been detrimental to the expansion of the national income (*i.e.* to the sum-total of the incomes of all citizens of Canada). As this income expands, as the result of what may be fairly termed greater efficiency in taxation, the same revenue as at present can be obtained by taxes imposed at lower rates than those of to-day.

The first of the taxes which the Commission recommends that the Provinces should renounce is the tax on personal incomes. Not all Provinces impose this tax. Those which get most revenue from it are often taxing incomes which other Provinces think that they should have a share in taxing, because they are in part at least earned in them although they are received in those Provinces in which investors live, or in which large corporations have their head offices. Nor is this all. The general equity of the whole Canadian tax system — and the Commission has been instructed to concern itself with equity as well as with efficiency in taxation — requires that the tax on personal incomes, which is one of the very few taxes capable of any desired graduation, should be used to supplement other taxes and should be uniform throughout Canada.

The second form of taxation which the Commission recommends that the Provinces should forgo includes those taxes imposed on corporations which individuals or partnerships, carrying on the same business as the corporation, would not be required to pay, and taxes on those businesses which only corporations engage in. They include, therefore, the tax on the net income of corporations and a multitude of taxes devised to raise revenue from particular classes of corporations which a Province cannot conveniently subject to a tax on net income. They do not include *bona fide* licence fees, the power to impose which would remain with the Province. These Provincial corporation taxes are peculiarly vexatious to those who pay them and particularly detrimental to the expansion of the national income. The cost of tax compliance is high. The tax is often payable by a corporation which has no net income. The tax is very likely to be a tax on costs rather than on profits. These taxes are also a frequent source of interprovincial jealousy. Great benefits may be expected if they are swept away and the equivalent revenue raised by Federal taxes chiefly on corporate net income.

To ask the Provinces to give up the entire revenue which they now derive from taxing corporations would, however, intensify a grievance of which the Commission received complaint in more than one Province; for the Dominion would receive a tax on income which was in part derived

from the depletion of irreplaceable natural wealth. It is clearly desirable that revenue of this character should be used for developmental work which will compensate for the damage which has been done to the resources of a Province. The Commission has, therefore, recommended that the Dominion should pay over to the Province concerned 10 per cent of the corporate income derived from the exploitation of the mineral wealth of the Province. When what is required is the conservation of natural resources by maintaining their productivity, rather than compensation for depletion by new investment, the Provinces are in a position to use their own taxing power.

The third tax which the Commission recommends that the Provinces should forgo consists of various forms of succession duty. These differ from the income taxes in that they have not hitherto been used by the Dominion : but they are taxes to which the Dominion might at any time be compelled to resort. The use made of them by the Provinces has given rise to bitter complaint because the Provinces have not made equitable arrangements with one another so as to tax each item in an estate in one Province only. The differences in rates between Provinces, and the dangers of double taxation, seriously distort investment in Canada.

At this point there must be a refinement in the calculations. What is significant for the purposes of the Commission is the size of the surplus or deficit which would exist in a Province if it were to provide the normal Canadian standard of services and impose taxation of normal severity. It is not the services which each Province is at present providing, but the average Canadian standard of services, that a Province must be put in a position to finance. It is not the revenue which its taxes yield at their present level which matters, but the revenue which it would derive from them if its people were as heavily taxed as Canadians in general. Just as in the case of debt it is necessary to take account of the fact that some Provinces are more accustomed than others to provide services for their people through municipalities or other agencies instead of directly. The Commission has, therefore, attempted to compute, Province by Province, what the cost would be if the Province and its municipalities taken together were to provide services on the Canadian standard. Adjustments have been made for the cost of the developmental services appropriate to the Province, and for the weight of taxation in the Province. The result has been that the Commission has been able to make a recommendation as to the amount, if any, which each individual Province should receive from the Dominion annually to enable it to provide normal Canadian services with no more than normal Canadian taxation. The Commission recommends that each Province found to be in need of such a payment should receive it by way of an annual National Adjustment Grant from the Dominion. This grant as originally fixed would be irreducible. The Commission recommends, however, that National Adjustment Grants should be re-appraised every five years. For special emergencies, which might arise in respect of any Province (and which exist in one Province to-day), special provision should be made, as it would be undesirable either to fix an annual grant in perpetuity on the basis of conditions that are transitory, or to fail to provide for serious emergencies.

The Commission also recommends the establishment of a small permanent

commission (which may be called the Finance Commission), assisted by an adequate technical staff, to advise upon all requests for new or increased grants, and to re-appraise the system of grants every five years.

The recommendations which have been described would, if implemented, safeguard the autonomy of every Province by ensuring to it the revenue necessary to provide services in accordance with the Canadian standard. Every Provincial Government (including those whose position will be so good as to make adjustment grants unnecessary) would be placed in a better financial position than it is in to-day. And the financial position of every Province would be immeasurably more secure than it is to-day. The Commission looks on this as its primary achievement. It is convinced that this fundamental problem must be faced and it has not been able to discover any alternative way in which it could be solved.

The recommendations which the Commission has made must be judged as a whole. They cannot with fairness either to the Provinces or to the Dominion be considered in isolation for any one of them taken alone might produce grotesque results.

At what cost, it may be asked, will the Provinces have secured these advantages? There will be a certain cost to the Dominion and, therefore, to the Dominion's taxpayers. The taxes forgone by the Provinces, if replaced by Dominion taxes of equal yield, would not provide all the money which the Dominion will probably be called on to pay under the Plan. It is necessary to say "probably" because the Dominion, unlike the Provinces, will be left with highly variable expenditures (*e.g.* those on unemployment relief) and variable revenues. The long-run effects of the proposed arrangements should, as has been explained, be to increase employment and to increase the national income and, therefore, the national revenue. But the expectation of the Commission is that the Dominion, in the first instance, will have to increase taxes somewhat. Even without increasing tax rates it will obviously increase the taxes payable by citizens of those Provinces which have no personal income tax to-day. It is hardly necessary to add that, in view of the end to be attained, the price seems low.

There will, of course, be adjustments. At every stage of the Commission's enquiry it has endeavoured to frame recommendations which, if implemented, will avoid the minor hardships or inequities that might result if the measures which have, perforce, been somewhat crudely described in this summary, were crudely applied. One or two examples will be given here. Others will be found in the Report itself. But the whole spirit of the Report would suggest that analogous adjustments should be made, even if the Commission has not thought of them and, therefore, has not mentioned them.

If the administration of a service or the collection of a tax is transferred from one Government to another it is desirable that those who have administered the service or collected the tax in the past should continue to do so in the future and that their skill and experience should not be lost to the nation nor their personal expectation of continuous employment disappointed. The Commission has, therefore, recommended that the Dominion, if it takes over a Provincial function, should continue the employment of those previously employed by the Provincial Government concerned. This recommendation

is particularly important when questions of language are involved.

If a tax now levied by one Government is to be replaced by a tax levied by another the new tax should be adjusted to the circumstances of the people on whom it is to be imposed, and advantage should be taken of the opportunity to design the new tax as equitably as possible. Thus, if the Dominion collects succession duties, it is important that the administration for their collection should be decentralised and that small estates should be rapidly cleared without correspondence having to go through Ottawa. And the taxation scales should be arranged so as to tax an estate more lightly when it is divided among many children.

If legislative powers (*e.g.* in relation to unemployment insurance) are to be conferred on the Dominion in addition to those which it now enjoys, it is important that they should be strictly defined so as to avoid the danger of their being extended by interpretation in unexpected ways which might interfere with the civil code in Quebec, or with the corresponding interests of other Provinces.

This brief summary would lose its way among details were it to attempt to enumerate the recommendations — some of them important recommendations — which the Commission has felt bound to make in its Report. What has been said should indicate the structure of the Dominion-Provincial financial relations which would, in the opinion of the Commission, characterise a healthy Federal system in Canada. Before passing on to mention a few of the subsidiary recommendations, it may be worth while to point out that the Commission's financial proposals are, in terms of the economic life of 1939, very similar to what the provisions of the British North America Act were in terms of the economic life of 1867.

As far as the municipalities were concerned, they are the creatures of the Provinces in which they are situated and their financial powers and duties are such as the Province chooses to confer on them. The financial plan which has been described has taken account of municipal expenditures and taxation as part of the Provincial picture and it will, if it is implemented, have very important indirect effects on municipal finance. It will relieve the municipalities of their share in providing relief for employables and their dependants. It will put every Provincial Government in a better position than it is in to-day for extending such aid as it may think fit to its municipalities, whether by relieving them of the cost of services which they now perform, or by contributing financially to the cost of these services.

In respect to marketing legislation great difficulty has been experienced in framing Dominion and Provincial legislation which will cover the whole field, even when the wishes of Dominion and Provinces are identical. The Commission has sought to remedy this situation by recommending that the Dominion and the Provinces should have concurrent legislative powers to deal with the marketing of a named list of natural products to which additions may be made from time to time by common consent.

Nor is this the only instance in which it has seemed appropriate that a power of delegation should form part of Canadian Federal relations. The Commission has recommended that this power should be quite general and that the Dominion should be able to delegate any of its legislative powers to

a Province, and that a Province should be able to delegate any of its legislative powers to the Dominion. Delegation should provide a convenient means of dealing with specific questions as they may arise from time to time without limiting in advance the power of either the Dominion or the Provinces. In some instances one or more of the Provinces might be prepared to delegate powers to the Dominion while other Provinces were unwilling, and in such cases the advantages of a power of delegation over constitutional amendment would lie in flexibility.

The Commission has come to consider the transportation problem of Canada one of the problems which cannot be solved without close collaboration between the Dominion and the Provinces. It realises, however, that its own technical competence is slight in this field and has, therefore, confined itself to discussing the issues which will have to be faced, in the hope of doing something to clarify the problem of jurisdiction. It points out, however, the great advantage which might be derived from a Transport Planning Commission which would be concerned both with planning transportation developments in a broad way, and with facilitating the co-operation between the Dominion and the Provinces in transportation matters which is necessary for the taxpayer.

Co-operation between the autonomous Governments of the Federal system has to-day become imperative. The Commission recommends as the principal means to this end that Dominion-Provincial Conferences, which have hitherto met at infrequent intervals, should now be regularised, and provision made for frequent meetings, say every year. It urges further that the Conference should be provided with an adequate and permanent secretariat for the purpose of serving the Conference directly, and of facilitating co-operation between the Dominion and the Provinces in general.

In conclusion of this summary it remains to add that the decisions underlying the recommendations contained in the Report were reached before the outbreak of war. The Commission decided, after deliberation, to complete the Report exactly as it would have been completed had war not been declared. The basic recommendations of the Commission concerning the re-allocation of the functions of Government and the financial relations of the Dominion and the Provinces were framed with the possibility of emergencies in mind and are, it is hoped, sufficiently flexible to be adjusted to any situation which the war may produce.

Of the subsidiary recommendations many are concerned with matters not in the least likely to be affected by the strains and stresses of war, while some may require modification in the light of events. The need for some action designed to enable the people of Canada to throw their whole weight into any great national effort, such as the struggle to which they have committed themselves, and at the same time to ensure the smooth working of the social and educational services on which the welfare of the mass of the people depends, is far greater and far more urgent in time of war and of post-war reorganisation than it is in time of peace. And it is precisely to these two main objectives that the chief recommendations of the Commission have been directed.

The financial proposals have been designed to enable every Province of

Canada to rely on having sufficient revenue at its command in war-time as in peace-time, in years of adversity as in years of prosperity, to carry out the important functions entrusted to it. They are also designed to produce this result while leaving the fiscal powers of the Dominion as wide in fact as they have always been in law, so that it may direct the wealth of the nation as the national interest may require. If some such adjustment of Canadian economic life appeared sufficiently urgent to lead to the appointment of the Commission in time of peace, how much more urgent is it in time of war? How much more urgent will it be in the critical transition from war to peace again? The Commission does not consider that its proposals are either centralising or decentralising in their combined effect but believes that they will conduce to the sane balance between these two tendencies which is the essence of a genuine Federal system and, therefore, the basis on which Canadian national unity can most securely rest.

APPENDIX II

Summary of Recommendations, made in the Report by the American Committee on Intergovernmental Fiscal Relations (Dr. Luther Gulick, Dr. Harold M. Groves and Dr. Mabel Newcomer), in Terms of an Action Programme for each Level of Government

I. FEDERAL GOVERNMENT

A. For Immediate Action

1. Negotiate with State representatives and pass legislation to create a Federal-State Fiscal Authority.
2. Amend the income tax law to make State income taxes deductible on an accrual basis even though other expenses are reported on a cash basis.
3. Revise, modernise and broaden the death tax credit.
4. Give the Federal estate tax a thorough overhauling, integrating death and gift taxes, substantially reducing exemptions and co-ordinating the Federal and State taxes.
5. Eliminate tax-exempt securities in a manner to secure States and municipalities against loss arising from the taxability of their securities.
6. Defeat discrimination resulting from State community-property laws by providing that they shall not apply in the operation of Federal tax laws.
7. Provide a clearing-house and "board of appeals" (Federal-State Fiscal Authority) for more careful and consistent treatment of payments in lieu of property taxes on Federally owned property. Such payments should be generous, especially during the war.
8. Provide a special joint committee of Congress to consider legislative proposals for payments in lieu of taxes; provide facilities for maintaining a permanent inventory of Government property.
9. Allow State sales tax application to contractors working on Government orders.
10. Modify and improve the co-ordination and efficiency in unemployment compensation by increasing the Federal credit from 90 to 100 per cent and requiring the States to furnish part of the cost of administration.
11. Disallow sales taxes as a deduction in Federal income tax practice; if the deduction is retained, make it general and not conditioned upon certain technicalities in the tax law.
12. Pay more heed to cost of compliance in framing tax laws.
13. Extend the Civil Service coverage to include all personnel engaged in Federal tax administration.
14. Consider the provision of a suitable bond instrumentality for the investment of State and Local surplus funds during the war. This might take

the form of a non-negotiable bond redeemable after the emergency or upon a showing of war-created need, and to be matched by the Federal Government if used for approved public works.¹

15. Continue and enhance co-operative efforts to improve State and Local accounting and reporting ; provide annual compilation of cost of government and total taxes.
16. Expend more effort on Federal-State collaboration in the administration of overlapping taxes.
17. Repeal the automobile use tax, or, if it is retained, require receipt as a condition for obtaining a State licence.
18. Further promote better uniform governmental accounting and reporting.
19. Assume the responsibility of annual calculation and publication of the over-all cost of government and other fundamental fiscal data.
20. Cultivate an attitude which regards States and Localities as partners in a joint enterprise.

B. For Immediate or Future Action

21. Develop in consultation with the States, standard rules for income and death tax jurisdiction ; develop suitable rewards for State compliance with these rules and other suitable procedures so that the Federal Government may serve as an umpire in multiple taxation disputes.
22. Develop in consultation with the States rules of uniform income tax procedure ; promote the adoption of such rules looking toward single administration of a relatively uniform State and Federal income tax.
23. Adopt a Federal-Collection-State-Sharing programme for the tobacco tax.
24. Enact legislation providing for Federal incorporation of corporations doing an inter-State business.
25. Provide distribution of welfare grants to the States through a graduated bracket system as suggested in the Connally amendment.

C. For Future Action

26. Abandon motor vehicle taxes to the States reserving the right to tax motor fuel used in aviation.
27. Inaugurate a thorough study of the cost of tax compliance and the burden of multiple taxation on inter-State companies ; reserve action on centralisation of business taxes until this evidence is available.
28. Use a public investment technique (if necessary) to cope with post-war deflation and unemployment ; dual Budget ; creative public works (health, housing, nutrition and regional development) ; full liquidation of outlays.
29. Reduce repressiveness of the tax system by de-emphasising business taxes and by equalising burden upon equity-financed companies compared with those financed by means of indebtedness (through a partial credit to the corporation for dividends paid out).
30. Broaden Federal aid to include relief and elementary education.
31. Broaden the Social Security programme to include uncovered groups under

¹ Written before recent developments which cover, to some extent, the needs of the States.

old-age insurance and unemployment compensation. This would not only provide more equitable coverage but would also make possible some simplification of pay-roll taxes.

32. Recognise a national minimum status for elementary education by provision of a differential (equalisation) grant.
33. Provide controls which will ensure improvement in the division of educational revenues, local districting, and the quality of the educational product, at the same time ensuring against coercive interference with Local autonomy and minority views concerning education.
34. Provide for Federal scholarships to ensure the adequate development of talent through higher education.
35. In the interest of simplification, repeal Federal liquor licence fees retaining licences where needed for administration.

D. Contingent Action

36. If a Federal retail sales tax is enacted, provide legislative implementation and administrative action to ensure the fullest co-operative use of State personnel and machinery.

II. STATE GOVERNMENTS

1. Negotiate with Federal representatives and collaborate in the development of a Federal-State Fiscal Authority.
2. Negotiate with Federal officials and Congress to inaugurate a programme for the elimination of tax-exempt securities in such manner as not to embarrass States and municipalities fiscally.
3. Tighten property exemption provisions; relax ceiling and uniformity requirements as to Local property tax levies; develop more adequate supervision of property tax administration.
4. In collaboration with municipalities, refrain from demanding unreasonable war-time aid from the Federal Government, thus recognising the importance of Local independence.
5. Apply surplus revenues, where possible, to the elimination of debt and the development of a reserve against war-time loss of revenue and post-war need for public works.
6. When revenues will permit, allow Federal income taxes as a deduction in calculating State income taxes.
7. Redouble attack on trade barriers, multiple taxation, and special inducements for the location of industry; use of education, reciprocal agreements and inter-State compacts toward these ends; pass legislation allowing credit to new residents for automobile licence taxes paid in the same year to other States.
8. Collaborate with the Federal Government looking toward Federal arbitration of jurisdictional disputes and joint determination and promotion of uniform practices in income and business taxation especially with regard to questions of jurisdiction.
9. Further collaborate with the Federal Government in the joint administration of overlapping taxes.

10. Adopt legislation on their own initiative that would make payment of Federal automobile use tax a condition for the receipt of a State licence.
11. Mitigate the rotten borough system by providing more adequate representation for cities in State legislatures.
12. Give more consideration to cities in the distribution of shared taxes, particularly motor vehicle taxes.
13. Adopt enabling legislation that would permit cities to supplement the general property tax with a rental tax on occupiers.
14. Adopt enabling legislation that would facilitate surplus financing during war-time.
15. Adopt legislation requiring more adequate and more uniform governmental accounting and reporting.
16. Cultivate an attitude that regards all Governments as partners in a joint enterprise.
17. Collaborate with the Federal Government on a broader and more generous programme of Federal aids, accepting controls, but insisting that they be co-operatively applied rather than dictated.

III. MUNICIPAL GOVERNMENTS

1. Negotiate with Federal representatives and collaborate in the development of a Federal-State Fiscal Authority.
2. Negotiate with Federal officials and Congress to inaugurate a programme for the elimination of tax-exempt securities that will not fiscally embarrass States and municipalities.
3. In collaboration with States, refrain from demanding unreasonable war-time aid from the Federal Government, thus recognising the importance of Local independence.
4. Apply surplus revenues, where possible, to the elimination of debt and the development of a reserve against war-time loss of revenue and post-war need for public works.
5. Broaden the property tax programme by supplementing the property tax with a rental tax on occupiers.
6. Strictly interpret property tax exemptions.
7. Inaugurate a thoroughgoing study of possible new sources of independent Local revenue.
8. Study successful procedures for safeguarding reserve funds, and enact legislation needed for this purpose.
9. Develop more metropolitan co-operation and the use of large metropolitan districts for financing functions of common interest.
10. Emphasise raw-material-producing districts' claim upon aids and shared taxes because their tax base does not represent their contribution to the national product.
11. Demand more equitable representation in State legislatures.
12. Demand more equitable distribution of shared revenues, particularly motor vehicle taxes.
13. Provide for more adequate governmental accounting and reporting.

14. Cultivate an attitude which regards all Governments as partners in a joint enterprise.
15. Prepare for collaboration with the Federal Government in a post-war public investment programme.
16. Collaborate with the Federal Government on a broader and more generous programme of Federal aids, accepting controls, but insisting that they be co-operatively applied rather than dictated.
